Structural imperfections, represented by this dislocation network in thin tantalum foil, determine the properties of a superconductor (electron transmission; 64,000x).

Superconductivity in Metals and Alloys

perconductivity—the absence of elec-cal resistance at very low temperatures s one of the most challenging of physical enomena. Its appeal is almost universal; application seems almost unlimited.

It has been suggested for use in friction-s bearings, motors, amplifiers, electro-gnets, gyroscopes and electron-beam paratus. IBM is concerned with still an-er possibility: the application of super-nductivity to computer devices.

Scientists at IBM Research have demon-ated, with a thin-film superconducting vice capable of switching in a few milli-croseconds, that computers of the future y be limited in their operating speeds ly by the speed of light. Whether or not a metal is a superconductor depends on many things: its structure, its valence, and the presence and position of alien atoms, missing atoms or electrons. The operation of superconducting devices depends upon the fact that a magnetic field will drive a superconductor into the normal (resistive) state.

A superconductor placed in a magnetic field develops a surface current which shields out any external magnetic field to a characteristic penetration depth. Since this penetration depth is comparable to the film thickness used in making superconducting devices, the penetration depth is an important property.

Superconducting alloys, with their inherent normal-state resistivity, offer promise for superior devices. Alloying can change the penetration depth, the electron density, and the ease by which a superconductor can be switched from one state to another.

Work is under way to outline the part played by impurities and structural defects in determining superconductivity. This work has already shown that microscopic homogeneity is a prerequisite of well-defined superconductive behavior. From such work may come devices that will make it possible to operate miniature computers at extremely high speeds.

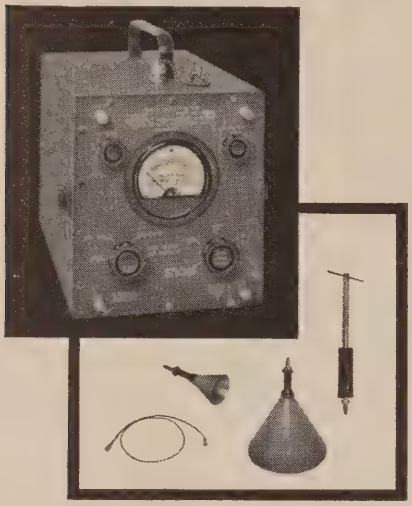
BROADBAND POWER DENSITY METER Model NF-157

For fast, accurate determination of RF power density and location of areas presenting RF hazards to personnel



Description: **A broadband device providing direct reading of RF power densities from 1 mw/cm² to 1000 mw/cm² (mid-scale readings), over the continuous frequency range from 200 to 10,000 MC.**

Features:

- Direct reading of power density insures immediate awareness of hazardous areas.
- Broad frequency range and high accuracy permit universal application to mapping of high level RF fields from VHF to X-Band.
- Accurate built-in step attenuator provides capability of handling power densities over a dynamic range of 10,000 to 1.
- Three constant-gain calibrated probes permit direct reading in mw/cm² over the continuous frequency range from 200 to 10,000 MC.
- Physical separation of probes from main unit vastly increases flexibility of applications.
- Battery-powered, light-weight design permits complete portability.
- Convenient carrying case simplifies transportation of instrument.
- Efficient shielding prevents stray RF pickup.
- Conservative design insures resistance to over-load.
- Main unit may be used independently as an accurate, rugged RF power meter over a wide power range.

PROCEEDINGS *really takes a beating . . .* *FROM ITS READERS!*

If you've been in many company libraries, we're sure you've seen "dog-eared" copies of *Proceedings*. It's not a case of poor paper and printing—we use the best quality—it's just an example of pass-along readership taken to extremes!

Of course, 57,334 (ABC) professionally qualified men receive individual copies of *Proceedings* at home each month, as well as 13,976 students in engineering colleges. What's the reason for this important following?

Proceedings of the IRE enlisted the aid of the John Fosdick Organization to take a survey of its many readers to find out what they thought. Here are some of their reactions. "We use *Proceedings* as a reference. It's really a text. Has the largest amount in proportion of text, the highest quality text, and the largest amount of informational advertising of any book in the industry." And, of special interest to advertisers, one chief engineer said, "I've saved half-a-million dollars by buying from ads in *Proceedings*, and I've bought a quarter of a million dollars worth of equipment from the ads."

Fact is, 100% of those interviewed said they have some purchasing responsibility! And, as a further indication of the effectiveness of using *Proceedings* to reach buying factors of electronic equipment, components and supplies, these readers expressed a 2 to 1 preference for *Proceedings* when compared with mentions of all the electronic books. (Survey available upon request—ask for it!)

Are *you* now reaching this important, select audience for your product? You can, you know, reach them 12 times a year in *Proceedings* for just $8,640. (1960 rates). A similar schedule in a semi-monthly would cost $29,087.50 . . . and in a weekly, $46,280! Call or write today for all the facts. Find out what selling power *Proceedings* really has! Reach 61,957 (net paid circulation) top-level radio-electronics men each and every month throughout the year!

For a share
in the present, and
a stake in the future,

ENGINEERED ELECTRONICS
EE

now you can choose

In designing digital systems and equipment employing EECO T-Series Transistor Circuits, you now have an extra choice—EECO Magnetic Core Circuits that are both physically and electrically compatible with the EECO T-Series. This new family of compatible magnetic core circuits for the frequency range 0 to 250 kcs includes a large selection of shift registers (in single or dual units), pulse gates, and core drivers.

ADVANTAGES

The ability of magnetic cores to maintain one of two discrete states makes them ideal for shift registers, or counters. A pulse sent through one set of windings will set the core to the "High-Level" state. A pulse sent through another set of windings will reset the core to the "Low-Level" state. Thus you get flip-flop action with a single core. In transistor circuits, on the other hand, it is normally necessary to use two transistors for each flip-flop.

Core circuits are used to good advantage in our line of shift registers. They offer versatility and space saving at a price lower than that of an equivalent transistor circuit.

COMPATIBILITY WITH T-SERIES

EECO Magnetic Core Circuits are electrically and physically compatible with EECO T-Series Transistor Circuits. They are packaged in T-Series containers, measuring ⅞″ diameter x 2$\frac{3}{16}$″ seated height, and they plug into the same miniature tube sockets as the T-Series.

ENGINEERED ELECTRONICS Company

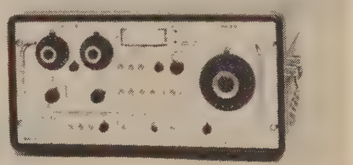
spot checks of performance. Although the basic unit provides for a single rate about a vertical axis, modified units can be furnished to provide multiple rates, tilting to polar or horizontal axes, or with servo drive.

For further information write for Catalog No. 152.

The Sterling T844 Rate turntable was displayed at the 1960 IRE Show.

Pulse And CW Signal Generator

New Pulse and CW Generator is now available from **Telonic Industries, Inc.**, Beech Grove, Ind. Designated as the Model PSX-1, the new unit produces video pulses, CW, pulsed CW, and audio modulated CW signals. The instrument is of value for the design and testing of precision IF amplifiers such as is used in radar systems, but also can serve in general laboratory applications.



The PSX-1 contains a complete video pulse generator section and an RF Section. Phantastrons and comparators produce video pulses with a repetition rate that is adjustable from 50 to 5000 cps. The width of each pulse is variable from 0.05 to 10 microseconds, with a rise-and-fall time of less than 0.02 microseconds. A front panel control allows the pulses to be advanced or retarded by 5 microseconds relative to the output synchronization signal, which consists of a 50-volt, one microsecond pulse with positive or negative polarity.

A CW oscillator and buffer circuits produce a signal that can be adjusted in frequency from 25 mc to 75 mc with an accuracy of 0.25 per cent. For CW operation, the output of the generator is 1 volt RMS into 50 volts, and is metered by a panel-front meter. This level is reduced by a toggle-switch attenuator, which provides 0–131 db attenuation in 1 db steps. A 0–10 db vernier attenuator is also provided for fine adjustments.

The CW signal can be modulated by video pulses, either by using the internal video-pulse circuit or by using an external source supplying pulses at a rate of from single pulses up to several megacycles. The output, under these conditions, is 10 to 12 volts, peak-to-peak. The "off" level between pulses is at least 65 db down from the pulse peak. Duty cycle is zero to 10%; pulse drop is less than 5%.

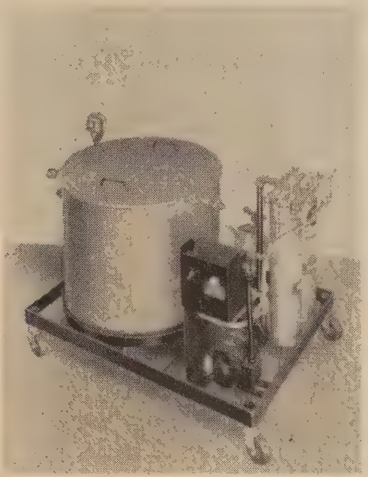
The CW signal may be audio modulated, using either an internal 1 kc oscillator or an external audio source, 50 to 5000 cps, 1 volt peak to peak into high impedance. The use of plate modulation of the buffer stage permits modulation from 0 to over 50%; the degree of modulation is metered on the instrument panel.

To simplify in production-line applications or wherever repetitive tests are to be conducted, eight preset positions can be adjusted to required pulse and widths.

For additional information contact the firm.

Rinse Water Repurification Equipment

Barnstead Still and Sterilizer Co., 2 Lanesville Terrace, Boston 31, Mass., announces the development of an ultra high purity rinse-water repurification unit. The unit is used in conjunction with ultrasonic cleaners; rinse tanks for transistors, diodes, and other small electronic parts; and any type of processing tank which must be kept supplied with pure water. The complete unit is mounted on a steel frame with wheels and is designed to roll under the counter containing the rinse chambers.



The contaminated rinse water is passed through an organic removal cartridge, through a mixed-resin cartridge to remove ionizable impurities, and through a submicron filter to remove submicroscopic particles to 0.45 microns. The repurified water has an electrical resistance of 10 to 18 megohms and is fed to the rinse tank to complete the cycle. Special heating elements and separate rinse chambers can be built into the unit, if required.

The unit consists of a Barnstead blocktin coated copper storage tank with a BD-22 Pressure Bantam® Demineralizer with disposable organic removal and mixed resin cartridges, an MF® Submicron Filter, and a stainless steel pump with starter. A Ventgard® on the storage tank protects the water in the tank from airborne contamination.

The components are available at various capacities so that specific customer requirements can be accommodated. All metal surfaces of this unit which contact

the
importance
of being

BISTABLE

(especially if you're a transistor driving a relay)

If you've been toying with the idea of using a transistor circuit to drive a relay, here are some facts of life that may save you grief later on. The watchword is bistable operation — particularly with regard to the transistor.

What can make a mess of an otherwise compact, cool, low standby-power transistor is a driving circuit that leaves the little pill neither saturated nor cut off. The transistor is then very apt to become an unstable, variable gain amplifier, when it should be taking a firm stand in favor of either "on" or "off". The thing to do is design the input circuit properly so that *it* is responsible for the transfer from one stable state to the other. (The Schmitt trigger circuit is an excellent for instance.)

Once you've got the transistor operating as a flip-flop and not as an amplifier, a good relay to use is a bistable type. Then the relay simply monitors the condition of the driving circuit, and success is practically around the corner (maybe). Magnetic latching relays are just such switches — and they have the added advantage of needing no standby power. Naturally, we have all sorts and kinds which all carry the designation "Form Zzzzz."

You won't be completely out of the woods, however, until you've given some thought to (a) operating speed and (b) nature of the transistor load. As for the former, you may be on the verge of transistorizing a tube-relay circuit and wonder why, all else being equal, the relay will operate slower from transistors. Although the transistor will do all sorts of wonderful things on less power, one thing it won't do on less power is hurry the relay. The remedy is adding some external resistance and raising the source voltage — or lowering the impedance of the relay. As for the load the transistor must switch, it is well to remember that if it's inductive (and a relay coil is) and the energy cannot be safely dissipated in the transistor, you'd better find another outlet. The lack of "arc suppression" in transistor circuits, when needed, may not produce juicy blue sparks but the result is the same — quite rapidly.

Some of our application engineers are notoriously bistable, and depending on which state they are in when they hear from you, will undoubtedly send you either (+) circuit design ideas (based on the use of a Sigma relay) or (−) some zzzzz-inducing printed material on bistable applications. Zatisfaction guaranteed.

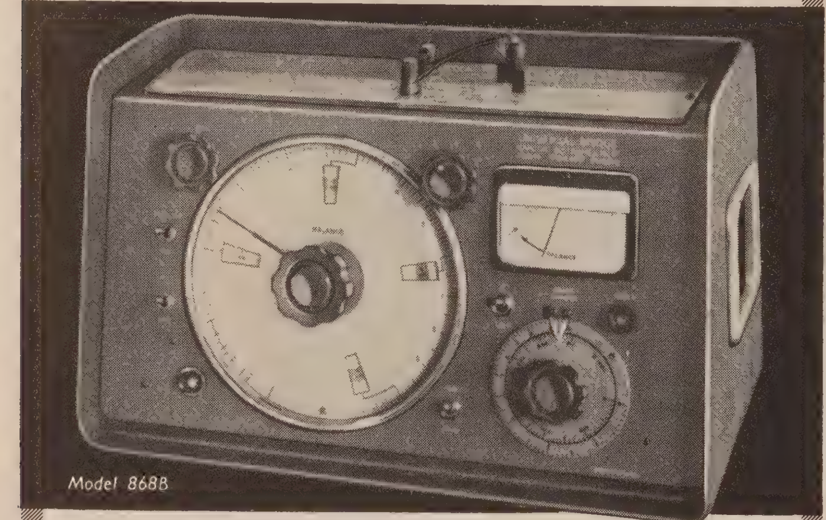
AN AFFILIATE OF THE FISHER-PIERCE CO. (Since 1939)

THE NEW MARCONI UNIVERSAL BRIDGE

Gives NEW Simplicity in LCR Measurements



L — 1 μH to 100 henrys
C — 1μμF to 100 μF
R — 0·1 ohm to 100 MΩ

•**Direct read-out with no multiplying factors, eliminates operator errors.** •**Model 868 B also has precision Q and tan δ (D) dials.** Inductance and capacitance are measured at 1 or 10 kc/s in an R-C ratio-arm bridge; resistance at d.c. in a Wheatstone bridge. The bridge detector gives positive indication of the direction of balance point even when far off-balance; as a result, components whose values are completely unknown can be evaluated in a few seconds with the minimum of searching. Detector a.g.c. eliminates the need for sensitivity controls.
Also available—**Low Capacitance Bridge Model 1342:** 0·002μμ F to 1,111μμ F; 3-terminal transformer ratio-arm bridge designed for precision measurement of extremely low capacitance.
For full details, write for leaflet D171.

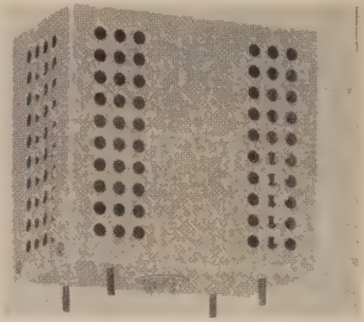
the repurified water are of pure block tin. The manufacturer states that a PM-18 Purity Meter, which gives readings from 100,000 to 18,000,000 ohms and is compensated up to 212°F, is available as an optional item. For further information write maker.

Power Supply



Harrison Laboratories, Inc., 45 Industrial Road, Berkeley Heights, N. J., announces the availability of its new Model 850 highly regulated transistor power supply. The unit is adjustable from 0 to 15 volts at any output current from 0 to 1 ampere. An octal plug is used for all input and output connections to the supply, including remote programming (333 ohms/volt) and remote sensing. Regulation is better than 3 millivolts; ripple, less than 500 microvolts for any combination of line or load. No voltage overshoot can occur at turn-off, and supply is fully protected for all overload conditions including a direct short across the output (no fuses employed). The unit measures $6\frac{1}{2}''$ L×$3\frac{7}{16}''$ W×6″ H. It is priced at $197.00. Rack Mounting Panels $3\frac{1}{2}''$ high are also available.

Table Top Analog Computer

A new "table-top" analog computer which solves mechanical, electrical, industrial and other problems which can be translated into mathematical data, is announced by **Applied Dynamics, Inc.,** a subsidiary of Bowmar Instrument Corp., P. O. Box 2068, Ann Arbor, Mich.

IMPULSE

A DIGEST OF NEW DEVELOPMENTS IN ELECTRONICS AND AUTOMATION

PUBLISHED BY ROME CABLE DIV. OF ALCOA, ROME, N. Y.
PIONEERS IN INSTRUMENTATION CABLE ENGINEERING

PATENT-LY ABSURD appears to be the way the House Space Committee feels about patent procedures currently in effect with NASA contractors. Provisions of the 1958 law establishing NASA spelled out restrictions on patent advantages when such came about through government-financed research. Complications arose when an individual firm also had contracts with the Pentagon, since these permit keeping patent rights. A new amendment reverses the original policy, even allows NASA to change provisions in existing contracts.

WHY NYET? Two items of interest to electronic men in reference to Russian developments: First, a Russian engineer reports at length in a Soviet periodical that lack of electronic standardization, particularly in coupling devices, is a serious problem. Second, *we* have put a technique called *predictive analysis* to work with a computer in order to simplify English translations of Russian scientific articles. Up to now the computer could produce only rough word-for-word translations. With predictive analysis, the machine approaches a sentence as a human does. As a result, the output contains not only the English translation, but also the grammatical relation of each word.

FM ON THE MOVE. One industry spokesman predicts that FM sales will hit 4 million units in 1963, including a million sets for use in automobiles. Still to be resolved is the big question of stereophonic broadcasting.

INTEREST in electric cars seems definitely on the increase. Considerable attention to fuel cells (a comprehensive book is almost ready for release), introduction of a silicon solar-cell panel, and advances in printed motor armatures all point to big things in the future.

CABLEMAN'S CORNER. To help you in replacing or reordering cable, it has become standard practice for most cable manufacturers to identify their cable in one of several ways. These include the stamping of solid conductors, the inclusion of marker threads or tapes within the cable structure, and surface printing or molding the insulations or jackets. Of these methods, the use of marker threads or tapes is the most popular. Manufacturers of Underwriters-labeled products are assigned specific colors for their marker threads, and most manufacturers extend the use of these same threads in other cable products whenever it is practical. Other information appearing on marker tapes often includes unit length markings and the date that the cable was manufactured. Phone Rome 3000, or write: Rome Cable Division of Alcoa, Department 400-A, Rome, New York.

These news items represent a digest of information found in many of the publications and periodicals of the electronics industry or related industries. They appear in brief here for easy and concentrated reading. Further information on each can be found in the original source material. Sources will be forwarded on request. ⑲

These manufacturers have invited PROCEEDINGS readers to write for literature and further technical information. Please mention your IRE affiliation.

(Continued from page 116A)

Basically it may contain from 4 to 32 amplifiers, depending upon applications. Modules may be used to expand the AD-1 to a full complement of 64 amplifiers. Four amplifiers are contained in each plug-in module. ADI states that the approximate $3000 price is for a complete 12-amplifier unit.

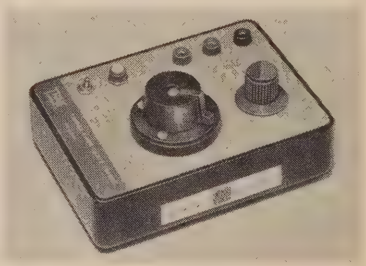
All integrating capacitors, matched feedback resistors and summing resistors are built into the computer, a factor said to simplify operation, improve accuracy, eliminate the need for external components, and reduce the number of patch cords required.

The instrument utilizes a basic reference of 100 volts, made possible through vacuum tube design. Circuits are less delicate and less sensitive to spurious coupling and provide more reliable and more easily read answers.

The entire computer is modular in design and expandable in all its assemblies to provide economical, non-obsolescent usage at the office, laboratory, department or small plant levels.

Additional details are available from the firm.

Tunnel Diode Curve Tracer



The TRAK® Tunnel Diode Curve Tracer available from **Trak Electronics Co., Div.** of CGS, 48 Danbury Rd., Wilton, Conn., is an instrument for use with a laboratory oscilloscope which presents the current-voltage characteristic of tunnel diodes throughout the negative resistance region. The instrument is provided with a clip for receiving both of the diode packages currently being manufactured.

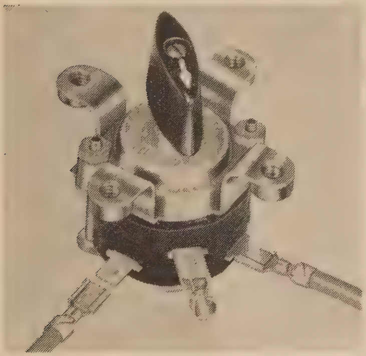
A four-position range switch adjusts the scale factor of the transformation from current to voltage for the vertical deflection signal and simultaneously changes the shunt impedance on the diode. The available range exceeds that necessary for testing currently available models in anticipation of improved diodes with different characteristics. The accuracy of conversion from current to voltage is ±1%; otherwise the accuracy in use depends upon the accuracy with which the deflection of the oscilloscope is calibrated.

A second knob controls the horizontal sweep voltage from zero to $1\frac{1}{2}$ volts.

Stray inductances are so small that diodes capable of oscillating at 2 kmc are adequately damped. The source impedance is approximately one ohm and the curve presented on the oscilloscope is continuous throughout the negative resistance region.

The unit is housed in an epoxy container measuring $1\frac{3}{4} \times 4 \times 5\frac{1}{4}$ inches and is operated from a 115 volt, 60 cps source. Price is $57.50 f.o.b. Wilton.

Rotary Power Switch



To permit rapid wiring with snap-on connectors, the 10-ampere ESCO Type P Rotary Snap Switch is now available from **Electro Switch Corp.,** King Ave., Weymouth, Boston 88, Mass., with male quick-connect terminals. These terminals, which are integral with the stationary contacts, can be furnished on any of the side-connected switches having either make-before-break or break-before-make contacts.

Detailed information is available from E. J. Dennehy, at the firm.

Solid State Counter-Timer

The Model 1039 10 mc counter-timer fully transistorized and designed for both commercial and military application is available from **Systron Corp.,** 950 Galindo St., Concord, Calif. It provides measurements of frequencies from 0 to 10 mc, time intervals and periods from 0.3 μsec to 10^8 sec, frequency ratios to 10^8 and phase measurements direct to 0.1°.

SYSTRON
12468260

The price is $2900. This is thought to be the lowest priced solid state 10 mc counter on the market and yet provides exclusive features of Nixie In-Line Readout, 3 dc amplifiers all with 1 megohm input impedance—0.1 volt rms sensitivity, and a panel height of $5\frac{1}{4}$ inches. With the complete elimination of vacuum tubes the power consumption is 50 watts and plug-in printed circuit boards are used to make this unit ideal for production testing where reliability and ease of maintenance are prime requisites. Delivery is 30 to 60 days. Complete specifications available.

LAPP INSULATION FOR WATER-COOLED SYSTEMS

For carrying cooling water which must undergo a change in potential, use of Lapp porcelain eliminates trouble arising from water contamination and conductivity, sludging and electrolytic attack of fittings. Permanent cleanness and high resistance of cooling water is assured with the completely vitrified, non-absorbent Lapp porcelain.

PORCELAIN WATER COILS

Twin hole or single hole models to provide flow of cooling water from 2 to 90 gallons per minute. Each assembly includes ceramic coil, aluminum mounting base, nickel plated brass attachment fittings . . . and is proof-tested to 100 lbs. per square inch water pressure.

PORCELAIN PIPE

Practically any piping layout can be made with these pieces . . . swivel flanges provide automatic alignment. Straight pipe up to 60″ lengths, 90° and 180° elbows, fittings for easy attachment to metal pipe; matching support insulators. Inside diameters ¾″ to 3″.

WRITE for Bulletin 301 containing complete description and specification data. Lapp Insulator Co., Inc., 224 Sumner Street, Le Roy, New York.

Frequency Calibrator

The Haddam Manufacturing Co., Inc., office at 30 Rockefeller Plaza, New York 20, N. Y., plant at Route 9, Haddam, Conn., announces a highly stable Secondary Frequency Standard in a portable transport case. Known as the Bailey ZEROBEAT, this instrument is particularly useful in the "netting in" of mobile FM communication systems. Simplified design makes it possible to check and correct the frequency of both receiver and transmitter of a given station in a matter of seconds.

A highly stabilized 100 kc crystal oscillator controls harmonic generators and multivibrators to produce signals in the HF, VHF, and UHF ranges. Output signals of sufficient amplitude are available to saturate the limiter of receivers at all assigned frequencies in the 30–50 mc, 150–170 mc, and 460 mc bands of the new split channel, narrow band mobile communications channels. Accuracy in field service is 2 parts per million (±.0002%) from 10°F to +125°F. In addition to FM applications, the Zerobeat will function in the normal manner of any secondary frequency standard and may be used as such. Audio output connection allows visual or audible zerobeating of signal being measured.

The instrument, packaged in a portable carrying case, measures $18\frac{7}{8}''$ wide, $11\frac{1}{8}''$ high, and $6\frac{1}{4}''$ deep, including removable cover; and weighs approximately 18 pounds. Standard 19″ wide panel mounting is available for use in rack or cabinet. Price is $495.00.

Clear Sintered Glass

The full range of sintered glasses used for glass-to-metal sealing can now be produced with a clarity that permits visual inspection of the seal.

Called Clearform, the materials are made by a new technique developed by **Corning Glass Works, Ceramics Dept., Electrical Prods., Div.,** Corning, N. Y.

Clearform was shown for the first time at the Radio Engineering Show in New York City.

Seals made with these materials can be readily checked for quality, according to the manufacturer, by observing the seal through the glass.

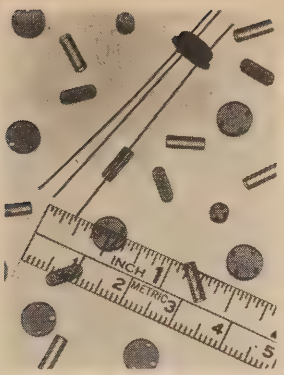
CAMBRIDGE COMMUNICATIONS CORPORATION
238 MAIN ST., CAMBRIDGE 42, MASS.
KIRKLAND 7-1997

A·S

Antenna Systems, Inc., is devoted exclusively to the design, fabrication and installation of antenna systems in the fields of scatter communications, missile tracking, space tracking, radar and surveillance, radio astronomy, and special antenna products.

We invite your inquiry, whatever your antenna problem may be. Write for our folder.

ANTENNA SYSTEMS INC.
HINGHAM, MASS.



Use of the materials provides a precise volume of glass in intricate shapes for critical sealing applications. The clear materials permit measurement of the stress patterns in the seal.

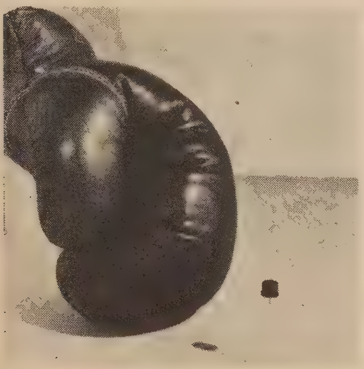
The sintered glasses are made by pressing small glass particles to shape and then firing the piece at high temperature. The particles are consolidated by fusion into a non-porous, vacuum-tight structure.

Clearform can be produced in a variety of shapes and sizes with extremely close tolerances. These materials retain the thermal endurance, corrosion resistance and dielectric strength of the parent glass.

Corning said the clear materials can be made from the glass compositions now used for sealing Dumet, Kovar, molybdenum, platinum and other metals.

Switching Transistor

A high-speed switching transistor, capable of surviving shocks in excess of 20,000 times the acceleration of gravity, has been developed by **Sylvania Electric Products Inc.**, a subsidiary of **General Telephone & Electronics Corp.**, Woburn, Mass.



Designed for use in telemetered torpedoes, projectile fuzes, electronically guided high-impact missiles, and other applications where extreme acceleration shocks are encountered, the new Sylvania transistor is capable of operation "during and after guaranteed minimum acceleration of 20,000Gs."

Designated 2N1473, the new Sylvania Transistor, a germanium alloy junction type, has "survived shock tests up to 140,000Gs," Dr. Pietempol stated. It will also perform critical switching functions in computers at currents up to 400 ma, he added.

Absolute maximum ratings for the 2N1473 are 40 volts Vcbo, 20 volts Vceo,

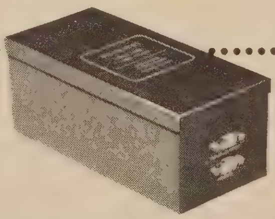
DEEP THOUGHTS FROM DEEP DOMES / NO. 5 OF A SERIES

Digby on Poverty

Admiral of the Fleet Sir Roger Twigger-Digby (1837-1899), noted as the first man ever launched from a cruiser in a Montgolfier balloon, said it concisely: *"Money talks? Poverty talks, too, but nobody wants to hear what it has to say."* Sir Roger, naval aviation's first (and last) hot-airman, should have lived to see HOOVER ELECTRONICS COMPANY'S approach to the problems of the poor.

We at HOOVER keep a specially sympathetic ear for those with budget problems . . . constantly striving to provide the *ultimate* in electronics systems, design, and shelf items at a *reasonable* price. The definition of "reasonable" is, of course, as flexible as a tomcat's morals, but the definition of HOOVER ELECTRONICS is still as rigid as a Guardman's back. Budget trouble? We take it in stride . . . and it's always a stride forward.



Here's an example: VERNITEL, the heart of the HOOVER system that improves FM/FM telemetering systems by a whole order of magnitude, yet saves money by prolonging their lives, in as humanitarian a gesture as you're likely to find in a day's ride. Write for complete specification sheets.

PULSED FOR POWER

Huggins Pulsed Amplifiers are designed to provide more power on their broad frequency band. Normally operating with a 10% duty cycle, they produce a peak power 10 times their CW output. Small signal and saturation gain are increased by as much as 10 DB.

Huggins Laboratories produces solenoid and PPM focused pulsed amplifiers:*

Freq.	Solenoid	PPM	CW	Pulsed
2-4 kmc	PA-4	PA-6	100 mw	1 watt
2-4 kmc	PA-3	PA-10	1 watt	10 watt
4-8	PA-7	PA-8	100 mw	1 watt
8-11	PA-1	PA-9	100 mw	1 watt
8.2-12.4	PA-5		50 mw	.5 watt

15 volts Vebo, 400 ma Ic, −50°C to +75°C storage temperature, +75°C junction temperature.

Sylvania's Semiconductor Division has its headquarters plant at Woburn, a manufacturing plant at Hillsboro, N. H., and a development laboratory at Northlake, Ill.

Transistorized Input Scanner

A new series of input scanners, transistorized for highly reliable operation in automatic data logging systems, has been announced by **Non-Linear Systems, Inc.,** Del Mar, Calif.

Interconnecting an NLS input scanner, NLS digital measuring instrument and data recorder produced an automatic system for sequentially scanning, measuring and recording up to 200 separate inputs. NLS Voltage Comparators can be connected to a similar system for go/no-go testing.

The three new, standard input scanners are the Model 260 which sequentially connects up to 100 single-pole channels to the digital voltmeter for measurement, the Model 261 for 200 single-pole channels, and the Model 262 for 100 double-pole channels. All three provide channel identification for the data recorder.

The new scanners are transistorized companions to transistorized digital voltmeters, ratiometers and ohmmeters. All logic functions in the new units are performed by semi-conductors instead of relays. Heavy-duty stepping switches with gold-plated contacts and extremely high insulation resistance are used.

The scanners can be controlled remotely, or manually by use of front panel controls. Channel identification is automatically recorded on the data printer and displayed in the readout by one-inch high, illuminated numerals. The readout is the NLS snap-out type for the fast bulb servicing without the use of tools or soldering. Transistor circuits are mounted on epoxy-fiberglass plug-in circuit boards for easy fast servicing.

For complete information, contact the firm.

Escon, New Subsidiary Of Glass-Tite

Glass-Tite Industries, Inc. 88 Spectacle St., Providence, R. I. has set up a new subsidiary, ESCON, Inc., according to Ralph Papitto, Glass-Tite founder and president. Frank Brakenwagen, formerly with Metals & Controls Corp., will have charge of the ESCON operation.

Glass-Tite Industries is a manufacturer of hermetic seals and terminals for semi-conductors, relays, crystal bases and custom applications in the electronics industry. ESCON, Inc. will specialize in such projects as manufacture of connectors for missiles, aircraft, computer and other electronic systems, with emphasis on custom applications.

Problems $\stackrel{+}{\times}\div$? For The Inquiring Mind !

In the final analysis, it's the product a company manufactures which determines the atmosphere surrounding an Electronic Engineer. If the company is dull and prosaic . . . endlessly stamping out millions of identical items . . . then it almost certainly follows that so-called engineering will be mundane and uninteresting. ☐ On the other hand, it's quite possible to be involved in work that's so far out it is insecure. Take missiles versus aircraft, for example. It appears now that missiles will inherit the mantle . . . **but which ones?** Yours might be a winner and it might not. ☐ Ours is one of the select few companies which offers stability plus the excitement of almost infinite variety. You see, we are completely occupied with unique electronic engineering problems relating to the development and production of thousands of different extremely precise devices. We're about as far as you can get from an assembly line, operating as we do on a special project basis for the nuclear weapons program. This makes BENDIX a fascinating place to work. Our long-term prime contract with the Atomic Energy Commission makes it a **secure** place to work. ☐ Our wonderful community adds the pleasures of comfortable suburban living to the rewards of a basically important line of endeavor. Our climate and terrain are much like those in Virginia. We have four mild but readily-identifiable seasons in a rolling, wooded landscape which is famous for its beauty. Housing is comfortable, inexpensive and close to work. We have excellent schools and universities, art galleries, a symphony orchestra and major league baseball. ☐ You'll like BENDIX and you'll like Kansas City. We guarantee it. Write Tim Tillman, Technical Placement Supervisor, Box 303-PH, Kansas City 41, Missouri. He will supply you with all details.

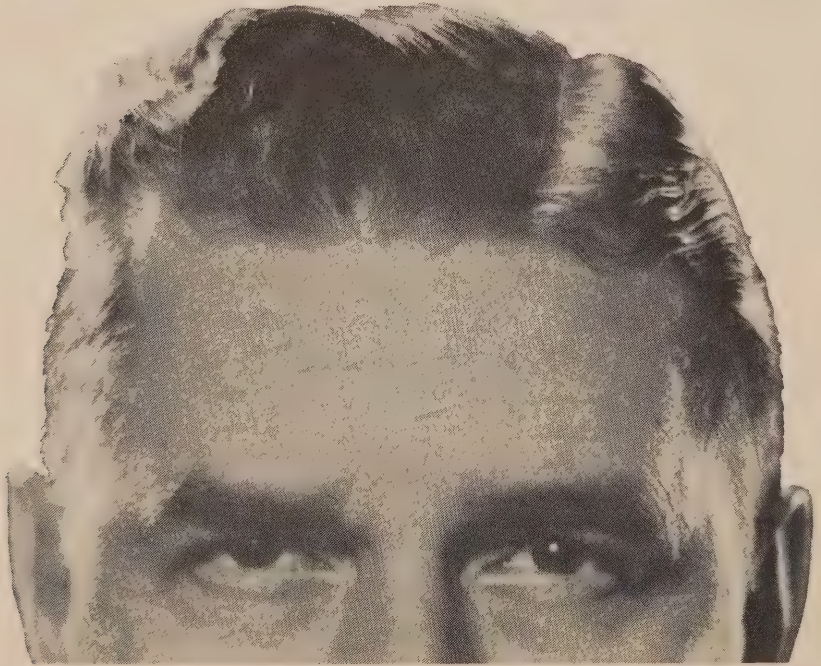
KANSAS CITY DIVISION



Positions Open

The following positions of interest to IRE members have been reported as open. Apply in writing, addressing reply to company mentioned or to Box No. . . . .

The Institute reserves the right to refuse any announcement without giving a reason for the refusal.

Proceedings of the IRE
1 East 79th St., New York 21, N.Y.

SENIOR ELECTRICAL ENGINEER

E.E. degree and 8-10 years experience including experience in electronics. Interesting work in conjunction with a nuclear physics research program. Benefits include a reduced tuition rate for the employee and free tuition for children of employees with 5 or more years of service. If interested, send complete resume, including salary expectations to J. R. Whitley, Employment Supervisor, University of Rochester, 260 Crittenden Blvd., Rochester 20, N.Y.

MEDICAL ELECTRONICS

Biophysical Electronics, Inc. devotes its efforts to the design and manufacture of instruments assisting the physician, psychologist, and research scientist to meet the challenge of preserving and extending life. Positions are open for: Senior Transistor Circuit Designer, Sales and Office Manager and experienced Electronic Technician. Submit resume, availability and salary requirements in first letter to Biophysical Electronics, Inc., New Hope, Pa.

ELECTRONICS ENGINEER OR PHYSICIST

High qualifications and varied experience, particularly in control, rf or nuclear electronics. Appointment as Assistant Professor at $7,000-$8,900 or as Associate Professor at $9,000-$11,700, or to non-academic position at equivalent salaries. To supervise construction of a spiral-ridge cyclotron to produce 50 Mev protons. Apply to Dr. B. G. Whitmore, Physics Dept., University of Manitoba, Winnipeg 9, Manitoba, Canada.

ENGINEER

To assist in construction of new cyclotron installation. Permanent position. Experience in building and maintaining scientific apparatus essential. Specific experience with cyclotrons desirable. Salary dependent on qualifications and experience. Apply to Dr. B. G. Whitmore, Physics Dept., University of Manitoba, Winnipeg 9, Manitoba, Canada.

TEACHING-RESEARCH, ELECTRICAL ENGINEERS

Expanding university program provides unusual opportunities for positions combining teaching and research. Rank and salary open. Teaching in all E.E. fields. Research primarily in microwave electronics. Apply: Dean E. C. Easton, Rutgers University, New Brunswick, New Jersey.

ELECTRONIC ENGINEERS

Positions open to Electronic Engineers teaching lecture and laboratory courses in a rapidly growing 4 year college. A background of servomechanisms, circuit analysis, microwaves, and/or transistors is desired. Applications desired from both academic and industrial personnel. Write, Harold P. Skamser, Dean of Engineering, Calif. State Polytechnic College, Kellog-Voorhis Campus, Pomona, Calif.

Demanding Assignments for
Senior Staff Members at

SYLVANIA RSL

Reconnaissance Systems Laboratory on the
SAN FRANCISCO PENINSULA

SENIOR SYSTEMS ENGINEERS

System management responsibility for new programs at Sylvania's Reconnaissance Systems Laboratory offers the broad spectrum of challenging problems involved in large reconnaissance systems. A minimum of 10 years experience is required in progressive assignments leading to and including systems analysis, determination of functional systems requirements and synthesis and integration of subsystems with over-all program requiring knowledge of the capabilities and limitations of techniques and components. Should have background in analysis and synthesis of HF and VHF communication systems employing a variety of modulation techniques and/or digital data handling and automatic control systems.

SENIOR DESIGN ENGINEERS

The design groups in RSL have openings for experienced engineers with six or more years of design and development background in one or more of these areas: communications receivers, digital tuning, RF distribution, DF equipment, magnetic tape recorders, teletype equipment, dynamic displays, demodulators, data transmission, data converters and computers. Opportunities for both technical specialists and supervisors.

THE REWARDS

Work in a compact and growing laboratory which offers the creative engineer the opportunity to grow with an expanding organization. Take advantage of the individual recognition and advancement opportunities of a small organization (approximately 200 employees) with the security, benefits and diversified opportunities of a large corporation. Enjoy the ideal northern California climate in relaxed suburban communities with good schools and recreational facilities for your family. Live within 40 minutes of cosmopolitan San Francisco. Know the advantages of being close to leading universities (Stanford is five miles north of the laboratory).

Complete information may be obtained by writing, in confidence,
to Mr. R. R. Keeffe at:

Herodotus, the historian, records (490 B.C.) the use of burnished shields for military signaling. This was the forerunner of the heliograph, invented by Sir Henry C. Mance, which came into wide use centuries later.

RONTIERS OF SPACE TECHNOLOGY IN

COMMUNICATIONS

Lockheed's interest in developing the science of communications extends from the depths of the oceans to deep space. Its Missiles and Space Division research programs deal with the development and application of statistical communication and decision theory in such areas as countermeasures; telemetry multiplexing and modulation; scatter communications; multiple vehicle tracking; millimeter wave generation and utilization; sonic signal detection and processing; avoidance of multipath degradation; and interference avoidance.

Associated research and development efforts are directed toward propagation studies and advanced antenna design; low noise amplifiers; vehicle borne signal transmission and reception, data storage and processing; solid state materials and devices.

The scope of such activities extends from advanced studies of naval communication problems on and under the oceans; the many applications to satellite vehicles; on to the specialized communication problems of deep space explorations. Latter needs are exemplified by high frequencies, low weight and power, high stability, low effective bandwidth, extreme reliability and basic simplicity requirements.

Engineers and Scientists: Investigating the entire spectrum of communications is typical of Lockheed Missiles and Space Division's broad diversification. The Division possesses complete capability in more than 40 areas of science and technology — from concept to operation. Its programs provide a fascinating challenge to creative engineers and scientists. They include: celestial mechanics; communications; computer research and development; electromagnetic wave propagation and radiation; electronics; the flight sciences; human engineering; magnetohydrodynamics; man in space; materials and processes; applied mathematics; oceanography; operations research and analysis; ionic, nuclear and plasma propulsion and exotic fuels; sonics; space medicine; space navigation; and space physics.

If you are experienced in work related to any of the above areas, you are invited to inquire into the interesting programs being conducted and planned at Lockheed. Write: Research and Development Staff, Dept. F-33, 962 W. El Camino Real, Sunnyvale, Calif. U.S. citizenship or existing Department of Defense industrial security clearance required.

electrical or mechanical engineers

INTERESTING DIVERSIFIED HIGH-LEVEL POSITIONS

Honeywell introduced the first successful autopilot of World War II—the C-1. Since then we have produced more flight control systems than any other company. Today we are engaged in producing the automatic flight control system and the rate stabilization control system for Project Mercury, the flight reference system for the Titan, the solid state autopilot for the F-104, and the adaptive autopilot which controls flight through aerodynamic surfaces and reaction nozzles for the X-15.

One result of our X-15 Adaptive Autopilot effort has been the creation of a permanent reaction control system and development section which has been assigned to our Components Design Department.

Because of our expansion in this area we now have openings for engineers with the following background and experience.

REACTION CONTROL SYSTEMS ENGINEERS

Requires background in missile propulsion systems analysis as it relates to reaction controls. Must be able to establish reaction control requirements by analysis of vehicle dynamics and have an understanding of propellant fuels and oxidizers for specific systems; handle heat transfer problems to optimize and compare several concepts for a given duty cycle; determine optimum over-all performance characteristics, thrust response with given inputs, and chamber pressure and oxidizer-fuel ratios for various nozzle heat sink designs; assist on all proposal efforts requiring propulsion system analysis.

REACTION CONTROL DEVELOPMENT ENGINEERS

Requires background in rocket engine design, specifically bipropellant type. Must be capable in valving design techniques for injection mixing, oxidizer to fuel ratio adjustment, positive shut-off and valve actuation methods, determining thrust at sea level and vacuum with various fuels and combustion chamber designs. Must have working knowledge of high temperature materials and materials compatible with exotic fuels and oxidizers; ability to determine the optimum configuration (nozzle, valves, torque motor, injectors, etc.) for given applications; ability to work with design and layout draftsmen, model makers, and evaluation engineers in following through with a design development.

If you are a qualified engineer, we would like to hear from you. Just drop a line including pertinent information on your background, interests, and accomplishments to Mr. James A. Burg, Dept. 662F, Honeywell Aeronautical Division, 1433 Stinson Blvd. N.E., Minneapolis 13, Minn.

Honeywell

H HONEYWELL *Military Products Group*

To explore professional opportunities in other Honeywell operations coast to coast, send your application in confidence to H. K. Eckstrom, Minneapolis 8, Minnesota.

TEACHER IN ELECTRICAL ENGINEERING

Teacher in E.E. beginning Sept. 1960. One qualified and interested in teaching fundamental undergraduate courses plus one graduate course. Ph.D. or MS. required with salary and rank dependent on qualifications. City location with many industrial contacts. Apply Dept. of E.E., Saint Louis University, St. Louis 8, Missouri.

STAFF ENGINEER

Research engineering position for creative person to form nucleus of a new section in the Electro-physical Labs. Will propose and evaluate new electronic component, circuit and systems concepts. Minimum experience and educational background would be 5 years with at least an MS. in E.E. or Physics. A Ph.D. degree would be preferred with strong interests in electronics, theoretical physics or mathematics. Forward resumes to Mr. R. D. Williams, Employment Mgr., P. R. Mallory & Co. Inc. 3029 E. Washington St., Indianapolis, Ind.

TEACHING POSITIONS

The E.E. Dept. of The City College of New York has several positions available on the teaching staff beginning September 1960. Rank and salary commensurate with qualifications and experience. Opportunity for graduate study. Applicants must be present resident of the U.S. Address inquiry to Prof. H. Taub. Dept. of E.E., The City College, Convent Ave., & 139th St., New York 31, N.Y.

ENGINEERS

The University of Denver's Research Institute is seeking graduate electronic engineers in the areas of circuit design and development, system design, and field engineering. Openings exist at all levels from engineers with advanced degrees and several years experience to recent graduates. Opportunities are available for advanced study or part-time teaching in the College of Engineering. Address inquiries to C. A. Hedberg, Head, Electronics Div., Denver Research Institute, University of Denver, Denver 10, Colo.

ELECTRONICS PATENT ATTORNEY OR AGENT

Eastern U.S. company engaged in a broad line of developments in the electronics field has an opening for a patent attorney or agent. Applicant should have excellent comprehension of electronics, together with some experience in patent prosecution. Salary and position will be dependent on background and indicated ability. In reply please supply information as to education, experience and salary expected. Box 2017.

PHYSICIST OR ELECTRICAL ENGINEER

Research on interaction between EM waves and structures or particles. An opportunity to do independent undirected research in the field of plasma or electron physics with excellent technical support and recognized colleagues. An experienced research with original ideas is desired. Salary $10,000 plus, depending on training and experience level. Write Box 2018.

Wire and Radio, Telephone

Range Systems Operations at Aeronutronic, through the immediate expansion of new and existing Range Development programs, has created a number of outstanding opportunities in the following areas:

Missile systems analysis	**Test equipment development**
Missile electronics	**Field test operations**
Downrange instrumentation	**Conceptual design of improved systems**

Positions are at Aeronutronic's new $22 million Engineering and Research Center in Newport Beach, Southern California—the West's most ideal location for living, working and year round recreation. Ford Motor Company employee benefits, considered the finest in the industry, are included.

Interested persons are invited to send resume or inquiries to Mr. L. L. Huling, Range Systems Operations, Aeronutronic, Dept. NR, Ford Road, Newport Beach, California.

RANGE SYSTEMS OPERATIONS | AERONUTRONIC
a Division of FORD MOTOR COMPANY

NEWPORT BEACH, SANTA ANA AND MAYWOOD, CALIFORNIA
NATICK, MASSACHUSETTS

Positions Open

ANALOG COMPUTER ENGINEER

The Standard Oil Co. (Ohio) has an immediate opening for an Analog Computer Engineer. A minimum of a B.S. in E.E. or Physics and 2-5 years analog experience is required. Applications are in the field of simulation and study of chemical and refining processes and process control systems. Salary commensurate with experience. Apply Mr. C. A. Bruggers, The Standard Oil Co. (Ohio), 1737 Midland Bldg., Cleveland, Ohio.

MEDICAL ENGINEERING

Electronics Engineer or Physicist. Permanent position in Dept. of Surgical Research of a large eastern university, involves design of new instruments, supervision of maintenance of equipment, and consulting with physicians. Salary range open. Send complete resume to Box 2019.

ENGINEER

Engineer to conduct a research and development program on instrumentation for data accumulation, reduction, and processing in geology, water resources investigations, photogrammetry, and allied fields including the development of new equipment and techniques for sensing, digitizing, logging, transmitting, storing, and processing of mass data. Contact Personnel Officer, U.S. GEOLOGICAL SURVEY, Washington 25, D.C.

ELECTRONIC ENGINEER

Electronic Engineer to teach lecture and laboratory courses. Up-to-date knowledge of the field required. Working and living conditions excellent; salary and opportunity very attractive. Write to Dean of Engineering, California State Polytechnic College, San Luis Obispo, Calif.

ELECTRICAL ENGINEERING

Excellent opportunities for qualified Ph.D.'s in logical design, network synthesis and other areas. Rank and salary commensurate with research and teaching qualifications. Teaching loads at all ranks are low. They are reduced further for those handling sponsored research projects. Each faculty member is expected to develop and maintain a strong research program. Send complete resume including research publications to Chairman, Dept. of E.E., Northwestern University, Evanston, Ill.

ELECTRICAL ENGINEERS

Electrical Engineering staff openings. Both graduate and undergraduate courses. M.S. required, Ph.D. desirable. Modern facilities. Active research program. Write: Joseph C. Michalowicz, Head, E.E. Dept., Catholic University, Washington 17, D.C.

ELECTRONIC ENGINEERS—TECHNICIANS

The Federal Aviation Agency needs qualified Electronic Engineers and Technicians in Alaska for installation and maintenance of electronic equipment and systems for air navigation, air traffic control, telecommunications, etc. Career Federal Civil Service qualification requirements and benefits. Moving costs paid. Annual compensation $6700 and up depending upon qualifications. Contact FAA, P.O. Box 440, Anchorage, Alaska.

(Continued on page 134A)

RELIABILITY — If a complex electronic equipment or system is not available for complete and immediate satisfactory operation, it is worthless to its user. The imperative need for greatly increased product reliability has spawned a new engineering art . . . Reliability Engineering.

Federal Electric pioneered much of the present day techniques in Reliability, and is engaged in one of the most extensive equipment and systems evaluation programs in industry. With an organization spread over most of the globe, serving under every conceivable operational condition, Federal Electric maintains a world-wide field data feedback system which provides comprehensive component, circuit and system failure data.

Already several years ahead of the industry, our Reliability Engineers today are actively aiding development and production engineers in their efforts to provide electronic products of greater sophistication and greater reliability. Hand in hand with these efforts are maintainability programs from which will result comprehensive design criteria for application, early in the design phase, of sound engineering principles to the problem of equipment maintenance.

The Equipment and Systems Evaluation Department of FEC's Central Engineering Division, at our Paramus home offices, is staffed with engineers whose collective skills and experience represent the state-of-the-art in Reliability. They are aided in their evaluation engineering by modern computer and communications equipment including the high-speed, accurate field failure reporting network.

Engineers with a degree in E.E. and experience in design and development or circuit analysis or field engineering are invited to inquire about outstanding positions in this group. Write Mr. H. R. Gudenberg, Dept. XX.

FEDERAL ELECTRIC CORPORATION
Service Division of International Telephone and Telegraph Corporation
Paramus Industrial Park, Paramus, New Jersey

ITT

How to take a longer look

The development of advanced electron tubes is just one of the many projects now under way at the Hughes Research Laboratories in Malibu, California.

at air space

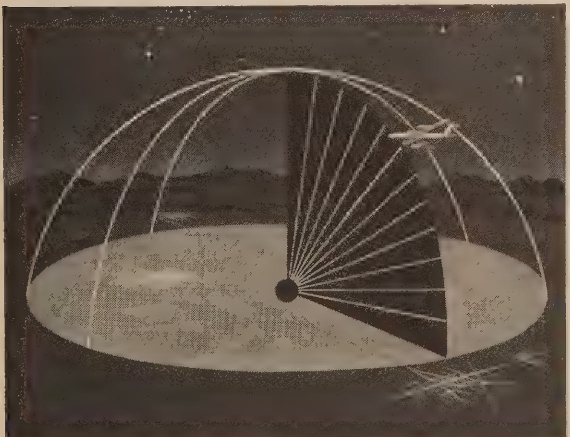
The problem presented to Hughes engineers: Build an airborne navigation, target acquisition, armament control system of far greater dimension than ever before.

Hughes engineers solved this challenging problem with several important state-of-the-art advances. One of the most significant was the development of a unique and highly advanced Traveling Wave Tube. This tube's two outstanding advantages: 1) higher power to provide greater range; 2) broader frequency band width for greater operational flexibility.

In addition, Hughes engineers designed a radar system that will discriminate against ground return and will detect targets at extreme ranges. Designed to operate in a "hard" counter-measures environment, the radar system was augmented with infrared detection and tracking.

This, and many other Hughes activities in virtually every area of advanced electronics provide the far-seeing engineer with a wide choice of interesting assignments.

A few representative project areas include: advanced data processing systems, molecular electronics, hydrofoil systems, anti-submarine warfare systems, advanced 3-D surface radar systems, space vehicles, nuclear electronics, miniaturized communication systems, ballistic missiles, infrared devices—and a great many others.



FRESCANAR is a Hughes development that gives umbrella-like radar protection. It positions radar beams by electronic rather than mechanical means.

The commercial activities of Hughes have many interesting assignments open for imaginative engineers to perform research, development, manufacturing of semiconductors, storage tubes, microwave components, radiation devices, and microwave tubes.

Whatever your field of interest, you'll find Hughes' diversity of advanced projects gives you widest possible latitude for professional and personal growth.

Newly instituted programs at Hughes have created immediate openings for engineers experienced in the following areas:

- Electroluminescence
- Infrared
- Solid State Physics
- Digital Computers
- Reliability & Quality Assurance
- Systems Design & Analysis
- RF Network Engineering
- Microwave & Storage Tubes
- Communications Systems
- Inertial Guidance
- Field Engineering
- Circuit Design & Evaluation

Write in confidence to Mr. R. A. Martin

ENGINEERS—PHYSICISTS

Company engaged in research, production and development of camera tubes, infrared devices and image amplifiers seeks graduate engineers and physicists to work in new laboratories at beautiful Fort Washington, Pa. Reply to Box 2020.

PROFESSOR

Rapidly expanding engineering school located in snow-free, smog-free area with ideal climate needs electronic engineer to teach undergraduate courses and to help develop graduate program. MS. minimum requirement. Salary dependent upon industrial experience and graduate degree. Modern facilities and equipment with new building under construction. Apply to Prof. M. P. Capp, Engineering Div., San Diego State College, San Diego 15, Calif.

TEACHING—RESEARCH

Positions at all ranks for well qualified persons with MS. or Ph.D. in developing department in an engineering school with a new program which emphasizes engineering sciences and interdepartmental teaching. Research presently in areas of signal detection and propagation with others being developed. 9 month or full year appointments available. Salary to $13,500 on full year basis. Write to A. T. Murphy, School of Engineering, University of Wichita, Wichita, Kansas.

TECHNICAL MANAGER

Advanced Data Processing Systems. Direct planning requirements for organization of comprehensive business information processing systems. Requires a Ph.D. in E. E., physics or math., plus several years experience in digital data processing systems. Managerial experience desirable. Attractive salary. Forward resume to Box 2021.

ASSISTANT PROFESSOR

Assistant Professor of Electrical Engineering. Ph.D. required with interest in circuit theory, physical electronics or solid state. Active research and graduate program. Contact W. P. Smith, Chairman, E. E. Dept., University of Kansas, Lawrence, Kansas.

ELECTRONIC TECHNICIANS

Electronic technicians available—June graduates of Sewanhaka High School, Floral Park, Long Island want full, part time jobs. Have had 3 years training in electronic and electrical shop and theory. Please contact Mr. Henry Aungst, Placement Director, Sewanhaka High School, 500 Tulip Ave., Floral Park, Long Island. Tel. Floral Park 4-1500.

ELECTRICAL OR ELECTRONICS ENGINEER

Large medical institution is interested in employing an engineer to direct the maintenance and trouble-shooting of a large variety of complex electrical instrumentation, and to make modifications in existing equipment. Position requires a person with a degree in E.E. and a minimum of 4 years experience in one or more of the following fields: electrical instrumentation; field engineering or electrical instruments; computers, f.m. tape equipment; telemetering equipment; radiation equipment and counters. Write Personnel Section, Mayo Clinic, Rochester, Minnesota.

CALIFORNIA

AGAIN THE LAND OF PROMISE

Science has brought us to a unique vantage point from which we can foresee vast technological change. As the curve of scientific progress approaches the vertical, today's pioneers who wish to contribute significantly in their chosen fields will do well to consider the unequalled challenge offered by association with one of the nation's foremost scientific laboratories. Positions are currently available in physics, electronics, mathematics, and in mechanical and aeronautical engineering, as well as in other technical disciplines.*

The diverse locations of the Naval Laboratories . . . the varieties of climate and recreation . . . assure your discovery of life as you want it. Address your inquiry to:

U. S. NAVAL LABORATORIES

in California
Personnel Coordinator, Dept. A

analytical, systems, components engineers

CHECK THESE OPENINGS IN FLIGHT CONTROLS WITH HONEYWELL AERONAUTICAL

Honeywell introduced the first successful electronic autopilot in 1941—the C-1 of World War II. Since, we have produced more flight control systems than any other company and have developed concepts in flight controls that are now standard in this field. Today, most top aircraft and missiles are equipped with Honeywell flight controls. Honeywell's Flight Control Systems Group has expanded steadily and now has openings for the following:

ANALYTICAL ENGINEERS—must be capable of simulating (mathematically on paper or computers) characteristics and problems in missiles and aircraft control, stability, and control systems. Should have good math backgrounds with analog computer experience.

SYSTEMS ENGINEERS—should be capable of interpreting analytical results into navigation, guidance, or flight control systems. Should be electrical engineers experienced in systems—ideally, with experience in flight control in the aviation industry.

COMPONENTS ENGINEERS—should be electronics men with emphasis on transistor circuitry. Will be responsible for designing components which go into the system. Must have circuitry design experience.

To discuss these or other openings, write Mr. James A. Burg, Dept. 662B, Aeronautical Division, 1433 Stinson Blvd., Minneapolis 13, Minn.

Honeywell

H Military Products Group

To explore professional opportunities in other Honeywell operations coast to coast, send your application in confidence to H. K. Eckstrom, Minneapolis 8, Minnesota.

Positions Wanted

By Armed Forces Veterans

In order to give a reasonably equal opportunity to all applicants and to avoid overcrowding of the corresponding column, the following rules have been adopted:

The IRE publishes free of charge notices of positions wanted by IRE members who are now in the Service or have received an honorable discharge. Such notices should not have more than five lines. They may be inserted only after a lapse of one month or more following a previous insertion and the maximum number of insertions is three per year. The IRE necessarily reserves the right to decline any announcement without assignment of reason.

Address replies to box number indicated, c/o IRE, 1 East 79th St., New York 21, N.Y.

MARKETING DIRECTOR-SALES MANAGER

Desires to relocate. Connecticut preferred. Excellent background in building and managing electronic sales organizations. Experienced in directing all phases of marketing activities. Age 37, married. Resume furnished on request. Box 2061 W.

UNIVERSITY ADMINISTRATOR

11 years college administration and teaching experience, plus industrial research, electronic design and development. Currently conducting year's research in industry. Have directed grant programs, technical adult education, research, taught undergraduate and graduate. BS. and MS. in E.E. Married. Age 36. Excellent references. Interested in challenging college position. Prefer Rocky Mountain area. Box 2062 W.

ELECTRICAL ENGINEER

BSEE. 1957. 1/Lt. Sig. C. 1½ years as Project Officer at WSMR, New Mexico. Experience in the field of guidance and countermeasures of missiles. Interested in obtaining a LL.B. Desires position which requires an engineering and legal combination with management opportunities. Box 2072 W.

ELECTRONICS ENGINEER

European assignment desired in western or southern Europe in management, technical or liaison area. 15 years experience R and D, both civilian and military, in communications, electronic countermeasures, television and missile electronics. Considerable supervisory experience. BEE. and MEE. degrees. Box 2073 W.

ELECTRONICS ENGINEER

BS. in Physics. MSEE. 5 years experience in transistorized digital computer circuit design and radar-computer systems. Single, age 28. Desires position in western Europe. Box 2074 W.

ENGINEERING MANAGER

Communications systems engineering of telephone, radio relay, microwave, HF and SSB Systems. 20 years military experience all phases applied engineering, siting, installation, operation and maintenance. Performed Staff Engineering assignments at Pentagon and major command levels. Currently Deputy Chief, Maintenance Engineering & Test Branch, multi-billion dollar air defense project office. Supervisory experience with over 500 personnel. 21 months military electronics schooling plus BBA. and MBA. and 14 months training with industry. Senior Member IRE. Desires managerial position with growth potential. Available August 1960. Box 2075 W.

ENGINEER

BS. graduate with electronics major desires position in component or systems design engineering. Have pilot license. Prefer Minnesota or midwest area. Box 2076 W.

SENIOR CONSULTING ENGINEER

Associate Professor of Nuclear Engineering desires summer employment leading to a consulting position; BSEE. 1949, MSEE. 1951; 7 years industrial and 3 years teaching experience in electronic and nucleonic instrumentation, microwaves and radioisotope techniques; active security clearance, AEC licenses, located in southwest. Box 2077 W.

ENGINEERING MANAGER

MSEE. degree. Background includes all levels in R and D to 3 years as manager of development groups. 12 years experience in analog and digital instrumentation, data processing, and automation with an even division between missile and industrial fields. Will relocate to either coast. Box 2078 W.

ENGINEERS:

A NEW CONCEPT IN PROFESSIONAL JOB SELECTION

New technical tests enable you to calculate your probability for success at LMED – in 1 hour at your own home!

BY GENERAL ELECTRIC'S LIGHT MILITARY ELECTRONICS DEPARTMENT

If you've been thinking of changing your job some day—or in the near future—but have hesitated because of the many uncertainties involved, Light Military's new concept in professional job selection will be of paramount interest to you.

What is it?

The new concept is based on a series of technical tests developed and pretested by Light Military engineers. They are designed to be taken, scored and evaluated by the individual engineer, all in the privacy of his own home. And, because the sole purpose is to provide you with a novel, objective means for self-appraisal, your score need not be divulged to us at any time.

Here's how it works:

First, fill out the coupon below and check off the tests which apply to your training and professional experience. Forward the completed coupon to us and in a few days you will receive the tests, a sealed answer sheet and explanatory material.

During a convenient hour at home, take the test and score it with the answer sheet provided. Then, compare your performance with the criterion group composed of Light Military engineers at all levels who took the same test. In most cases you will be able to relate your score to years of experience, from 2 to more than 10.

What it measures:

If your adjusted score is equal to, or more than the years of experience you possess, the probability is excellent that a significant community of technical interest exists between you and The Light Military Department. In addition, a valid assumption can be made that a high probability for success awaits you here. And remember, your score need not be divulged to us at any time; it is for your own guidance exclusively!

……

CURRENT AREAS OF ACTIVITY AT THE LIGHT MILITARY DEPT.

SPACE COMMUNICATIONS & TELEMETRY • MISSILE & SATELLITE COMPUTERS • SPACE VEHICLE GUIDANCE • UNDERSEA WARFARE SYSTEMS • THERMOPLASTIC DATA STORAGE • SPACE DETECTION & SURVEILLANCE • COMMAND GUIDANCE & INSTRUMENTATION • INFRARED MISSILE APPLICATIONS

……

Facts about the tests

1 Each technical test is composed of 40 multiple choice questions.

2 To find answers for some questions, mathematics is involved—but only to the degree normally associated with the work.

3 The "mix" of questions includes some easy ones, some bordering on the state of the art.

4 None of our engineers achieved a perfect score.

5 The test for Engineering Administration is psychological, designed to reveal aptitudes and abilities most often found in good engineering managers or administrators.

MAIL THIS COUPON FOR YOUR TESTS

Mr. R. Bach
Light Military Electronics Dept.
General Electric Company, French Road, Utica, New York

Please send me tests (limited to 2 subjects per individual) answer and self-evaluation sheets covering the areas checked:

☐ RADAR ☐ MICROWAVE ☐ ELECTRONIC PACKAGING (ME)
☐ COMMUNICATIONS ☐ ADMINISTRATIVE ENGINEERING

An Invitation To Join ORO...Pioneer In Operations Research

Operations Research is a young science, earning recognition rapidly as a significant aid to decision-making. It employs the services of mathematicians, physicists, economists, engineers, political scientists, psychologists, and others working on teams to synthesize all phases of a problem.

At ORO, a civilian and non-governmental organization, you will become one of a team assigned to vital military problems in the area of tactics, strategy, logistics, weapons systems analysis and communications.

No other Operations Research organization has the broad experience of ORO. Founded in 1948 by Dr. Ellis A. Johnson, pioneer of U. S. Opsearch, ORO's research findings have influenced decision-making on the highest military levels.

ORO's professional atmosphere encourages those with initiative and imagination to broaden their scientific capabilities. For example, staff members are taught to "program" their own material for the Univac computer so that they can use its services at any time they so desire.

ORO starting salaries are competitive with those of industry and other private research organizations. Promotions are based solely on merit. The "fringe" benefits offered are ahead of those given by many companies.

The cultural and historical features which attract visitors to Washington, D. C. are but a short drive from the pleasant Bethesda suburb in which ORO is located. Attractive homes and apartments are within walking distance and readily available in all price ranges. Schools are excellent.

ELECTRONICS ENGINEER

Mature, very active, electronics engineer anticipating retirement from technical military duties at 50 interested in challenging Engineering Management position; 7 years complex electric power service problems; 19 years broad Navy engineering management duties in diverse U.S. and overseas communications and antisubmarine electronics systems projects and construction, scheduling work. Trained to relocate periodically on short notice and quickly assume specific responsibility for important technical projects requiring smooth coordination with other staff specialists. Outstanding references and accomplishments. Recent technical refresher training. Particularly interested in Phila. Pa. or Calif. areas, but will consider any long range opportunity. Box 2079 W.

ENGINEER

Supervisory engineer of systems or sales on systems management or evaluation of electromechanical weapons system equipment in radar, computers, etc. and microwave components. Have excellent market and sales background with industrial and government agencies on prime hardware or components. Home base New York City or Long Island. Will travel extensively if necessary. MSEE. Matured. Formerly Lt. Colonel in the USAF. Box 2080 W.

TEACHING

British, age 35; Member IRE, IEE. Telecommunications engineering diploma. 10 years lecturing, 4 years as head of department. Seeks U.S. teaching appointment in E.E. Dept. where facilities exist for working towards MS. degree. Experienced administrator. Visited U.S. 1959. Familiar with E.E. curricula. Specialties; circuitry and measurements. Frustrated by bureaucracy. Box 2081 W.

ENGINEER

Communications equipment, design circuitry and hardware. BSEE., MSEE. Seeks assignment Continental Europe. Top Drawer company only. Age 34; 9 years experience. Box 2082 W.

ELECTRICAL ENGINEER

5 yr. E.E. plus good Liberal Arts background. Polyglot; age 31; family; lifelong U.S. citizen. Diverse experience ranging from power during military, 3½ years design and manufacture electric electronic instrumentation and control, 2 years solid state R and D, 1 year specifications and estimating for contracts and projects, 4½ years supervisory, presently project level problem solver and trouble shooter for large company on communication, navigation, ultrasonic and control. Box 2084 W.

ELECTRONICS ENGINEER

AB., BSEE. Columbia; Tau Beta Pi, Eta Kappa Nu. Some graduate E.E. and physics. LTJG, U.S. Navy; Destroyer electronics and E.C.M. Officer, 9 months; Electronics Instructor, D.A.S.A., 2½ years. Married, family. Desires R and D position in east with management opportunities. Available September 1960. Box 2085 W.

ADMINISTRATIVE ENGINEER

Desires position of responsibility as Technical and Administrative Assistant to Director of Engineering or General Manager in U.S. or overseas. 10 years varied experience in Military and Comm. Elec. Systems. Shared responsibility for 5 million European Plant. Resume sent to management. Box 2091 W.

ELECTRICAL ENGINEER

Four years active duty as Naval Officer. MSEE. University of Illinois 1958. Last 2 years spent in development of high power klystron transmission systems and system controls. Desires position in system management or administration in medium sized concern. Box 2092 W.

ELECTRONIC ENGINEER

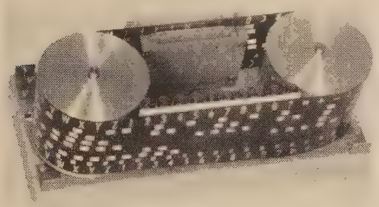
Position desired in commercial product or industrial automation fields. 15 years experience in data processing and display fields. MS. in E.E. Preferred location—Southwest. Box 2093 W.

NEWS New Products

(Continued from page 122A)

Read-Out Device

A versatile new read-out device, RANDID (Rapid Alpha Numeric Digital Indicating Device), has been developed by **Hazeltine Corp.,** Little Neck 62, N. Y.



The characters or symbols to be displayed are photographically reproduced on the belt and appear as transparent characters on an opaque background. Code tracks, which are similarly reproduced on the belt, provide a binary coded identification of each character. By suitably scanning the code tracks with incandescent lamps and phototransistors, a code signal is generated which serves to identify the location of each character on the belt.

Change of characters or character style can be accomplished merely by changing the belt, an operation which takes but a few minutes. Because of its unique design, RANDID can be utilized where a multi-window, multi-line display is required. Some of its applications include: Aircraft Panel Display, Digital Data Transmission Monitor, Card or Tape/reader/verifier, Visual Decoder, Information Retrieval Display, Computer Readout, Small Tote Board, Test Equipment Readout, etc.

The display of a particular character in a particular display window occurs when the generated binary code signal corresponding to the selected character and display position, agrees with the binary code of the input signal. When the two codes agree, a high intensity neon lamp is fired which stroboscopically illuminates

NOW—CHOOSE YOUR ASSIGNMENT AND LOCATION THROUGH OUR NATION-WIDE PLACEMENT SERVICE

SALARIES $7,500 TO $18,000

We can offer you a large selection of diversified positions with America's foremost electronic organizations. Some positions for non-citizens.

The following are just a few of a large number of desirable opportunities.

SR. ENGR.—DIGITAL COMPUTERS— Exp. required in systems, logical design, packaging, system integration or pulse circuitry. To $15,000

FLIGHT TEST EVALUATION—Sr. Opp in Ground & Flight Test on data links, precision transducers, telemetering equipment, power supplies, circuit monitors and impedance matching units. To $15,000

RF ANTENNA—Proj. Engr. $15,000

INFRA RED—Proj . Engr. $15,000

CIRCUIT DESIGNERS — 2-5 years Transistor experience. $11,000

ADVANCED SYSTEM DEVELOPMENT —Supervisory position in digital computer, fire control or missile guidance development. To $17,000

PHYSICIST Phd.—Nuclear experience pertaining to radiation from propulsion units—unusual opportunity. To $18,000

PROJECT LEADER—Antenna Pedestals. $13,000

SR. ENGINEER—DEVELOP Airborne & spaceborne communications systems. $15,000

Just tell us what you would like to do and where you would like to locate, and we will handle everything for you without cost or obligation.

HAncock 6-8400

Announcing an
OUTSTANDING OPPORTUNITY
for Research in Engineering
ELECTRONICS AND PHYSICS

Southern Research Institute has openings for senior electronic engineers or engineering physicists in the field of instrument development. Current activities on an expanding series of projects can be summarized by the title Photoelectronics. Successful progress on the work calls for advancing frontiers in electronic circuits, physical and geometrical optics, and kinematic design of instrument components.

An applicant should preferably have an M.S. or Ph.D. degree in electrical engineering or engineering physics, or equivalent experience, and should have a keen desire to become a leader in this field.

If you are looking for an opportunity to work in this interesting and challenging field, please write, giving a summary of your education and experience to

SOUTHERN RESEARCH INSTITUTE
Birmingham 5, Alabama

(Continued from page 139A)

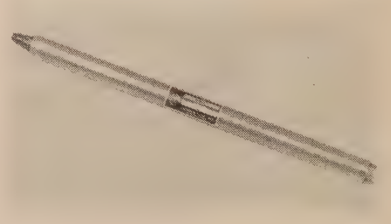
the selected character. The belt speed, and thus the stroboscopic repetition rate of each character, is such as to present a flickerless display. Typical repetition rates vary from 30 to 60 strobes per second with motor speeds of from 1800 to 3600 RPM. Rotational speed changes cause only a change in the repetition rate and do not otherwise affect the display of information.

Transistorized circuits affording electronic storage facilities, code comparison and strobe drivers are contained in a unit which can be located remotely from the display unit. The electronic storage facilities enable RANDID to accept input information in either dc or pulse binary-coded decimal form and permit nondestructive readout of the displayed information.

The flexibility of RANDID affords variation of input codes (i.e. 4–6 bit etc.), character size and/or style, number of characters per line, number of lines per display. A distinctive feature of RANDID, desired in many applications, is selective address and erasure. Since RANDID may be produced in various sizes and forms, prices and delivery dates on this new development are dependent upon customer specifications and applications.

Electrostatically Focused TWT

Typical of the line of electrostatically focused, L-Band Amplifier Traveling Wave Tubes being manufactured by **Huggins Laboratories,** 99 E. Arques Ave., Sunnyvale, Calif., is the HA 27. This tube operates on a frequency range of 1.0 to 2.0 kmc with a small signal gain of 30 db minimum and a saturation power output of 7 dbm minimum. Savings in weight and size have been effected in the HA 27 which measures 1″ in diameter and 16″ in length. Net weight is 1.0 lb. The HA 27 meets the requirements of military specifications in operating temperatures, vibration and shock performance.



No magnetic structure either solenoid or permanent magnet is needed by the HA 27. Complete characteristics and prices may be secured by writing to Huggins.

Microminiature Rivets

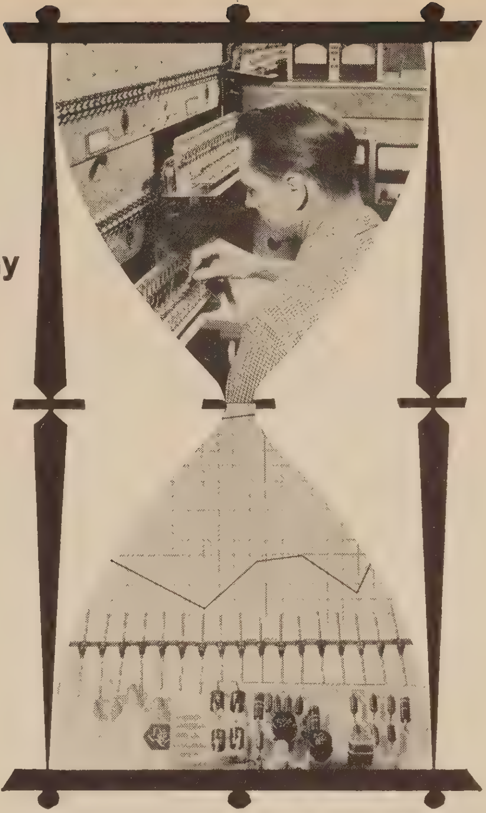
A new fastener for subminiature electronic and instrument needs has been announced by the **Circon Component Corp.,** Santa Barbara Municipal Airport, Goleta, Calif.

(Continued on page 142A)

T/I

needs an S-C product engineer
whose design philosophy
is reliability

to develop and improve diodes,
regulators, rectifiers,
capacitors, resistors



succeed
in '60
with
T/I

At TI's Semiconductor-Components division, product engineers of integrity have the opportunity of putting their talents to work in an atmosphere where reliability is the only acceptable design philosophy. Here the daily challenge is to make the world's best semiconductor products at the lowest possible cost without sacrificing dependability. ■ As a TI S-C product engineer it would be your responsibility to strive constantly to adopt new techniques and technologies toward improvement, simplification and increased reliability of existing processes and products. ■ We now require product engineers to undertake challenging key assignments in reliable design, development and evaluation of ultra-fast computer diodes, tunnel diodes, rectifiers, controlled rectifiers, voltage regulators, resistors, and tantalum and other advanced types of capacitors. ■ You qualify as a product engineer for semiconductor component projects if you have a degree in Electrical Engineering, Physics or Physical Chemistry and at least three years experience in diode, capacitor or resistor design and circuitry.

OTHER PROFESSIONAL POSTS AVAILABLE:

- Component Packaging Engineers
- Circuit Development Engineers
- Test Equipment Engineers
- Electronic Sub-Systems Engineers (Standard and Modular)

INTERVIEWS in your area will be held in the near future. If you qualify for positions described, please send resume immediately to C. A. BESIO, DEPT. 115.

NEW OPPORTUNITIES IN

LOW-NOISE AMPLIFIERS
SEMICONDUCTOR DEVICES
MICROWAVE CIRCUITS
PHOTOEMITTER SURFACES
ELECTRON-BEAM DYNAMICS
DISPLAY DEVICES
TV AND RADIO RECEIVER DESIGN

AT ZENITH®

Chicago, Ill., and Menlo Park, Calif.

The continuing expansion program at Zenith has created new opportunities for engineers with experience in the above fields.

The fast-wave **electron-beam parametric amplifier,** conceived at Zenith, has opened up challenging new fields for research and development activity from UHF to SHF bands. Broad company interests in the microwave-tube area provide fertile atmosphere for original ideas and individual initiative.

An expanding research program in new fields centered around **compound semiconductors** provides opportunities for individuals with backgrounds in the solid-state art. Development of special devices for highly specific purposes, in collaboration with applications engineers, represents another area of active interest in the semiconductor field.

Positions are now available in the Research Department at Chicago; some openings are available in the San Francisco Bay Area. Congenial small-group atmosphere prevails, with all the advantages of a large, progressive company.

Interested applicants please contact:

RESEARCH AND DEVELOPMENT DEPARTMENT
OF CONTINENTAL OIL COMPANY,
PONCA CITY, OKLAHOMA

has immediate opening—EE or Physics. Advanced Degree or equivalent with experience in design and fabrication of electronic instruments. Salary commensurate with experience. Send detailed résumé to

INDUSTRIAL RELATIONS DEPARTMENT
CONTINENTAL OIL COMPANY
PONCA CITY, OKLAHOMA

These manufacturers have invited PROCEEDINGS readers to write for literature and further technical information. Please mention your IRE affiliation.

(Continued from page 140A)

The rivet type fastener embodies an entire line in sizes smaller than the smallest rivets heretofore commercially available. It will make immediately available from stock specialized rivets which previously have had to be fabricated by the user. Many sizes in the line are smaller than can be produced on conventional rivet making machinery.

The head form is a modified brazier with low contour and minimum functional diameter for the stresses imposed.

Mechanical design of the new rivet has been directed specifically toward instrumentation and electronic use. It combines advantages of both solid and tubular rivet styles in a concentrically deep drilled shank. This provides the ease of setting so essential in small or delicate assemblies. The solid upper portion of the rivet contributes rigidity and prevents buckling or bending in the upsetting or clinching operation. The drilled section controls material flow and accomplishes an effective clinch with a minimum of pressure on the parts or material being assembled.

Material is specification non-magnetic brass with the alloy controlled to insure setting ease and uniformity of the swaged or upset clinch.

The instrument finish which is 24 carat gold electropolated and shot burnished will be standard on the new microminiature rivet line. This finish is impervious to rigorous environments, provides a good electrical contact and retains its soldering characteristics indefinitely.

Quality Assurance For Printed Circuits System

A complete quality assurance system for the manufacture of printed circuits is described in an illustrated technical bulletin just published by **Photocircuits Corp.,** one of the leading manufacturers of printed circuits and precision devices employing printed circuits

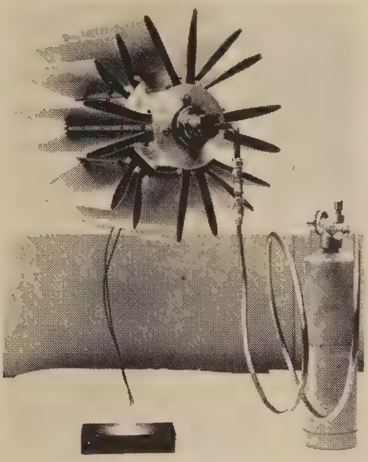
The two color bulletin covers in detail quality control procedures in accordance with military specifications MIL-Q-9858 and MIL-STD-105.

Functions of the quality assurance system outlined in the bulletin include interpretation of customer specifications; transformation of specifications into quality assurance criteria and procedures; use of statistical techniques, control charts and methods to maintain consistent quality; maintaining records, process averages and issuing reports; performance of studies on capabilities of all processes, machines and tools; conducting special studies and experiments; and selection of suppliers and determining vendor quality conformance.

Copies of the New technical bulletin Number P-10, "Quality Assurance for Printed Wiring," are now available on request from Department 1700, Photocircuits Corp., 31 Sea Cliff Ave., Glen Cove, New York.

Thermoelectric Generator

General Instrument Corp., Thermoelectric Div., Newark, N. J. (March 22, 1960) placed on the market a small (one-foot high), lightweight (10 pounds) automatic "power plant," with no moving parts, that can produce electricity for a year on $10 worth of ordinary propane gas and will keep running as long as the fuel supply lasts.



Believed by the Company to be "the first practical thermoelectric generator actually to be made commercially available in the United States," the unit is designed as "ultra-reliable and unmanned source of power" for radio communications, sea and air navigational aids, and industrial and scientific instrumentation in remote areas where other sources of electricity are not available or—as in the case of batteries—have a short life span and must be replaced or recharged.

The generator is expected to be priced at $500 or less in large-scale production quantities, it was stated, and will be available to both government agencies and industry at large. Single "evaluation samples" are available at a price of approximately $5,000.

The new generator (which employs "thermopiles" of semiconductor elements to convert the heat of the burning propane into electricity) produces five watts of power, steadily and continuously, for as long as the fuel supply lasts, it was stated. It has been designed to run for approximately a year on a 200 pound tank (50 gallons) of propane gas, which sells commercially for about five cents a pound. By

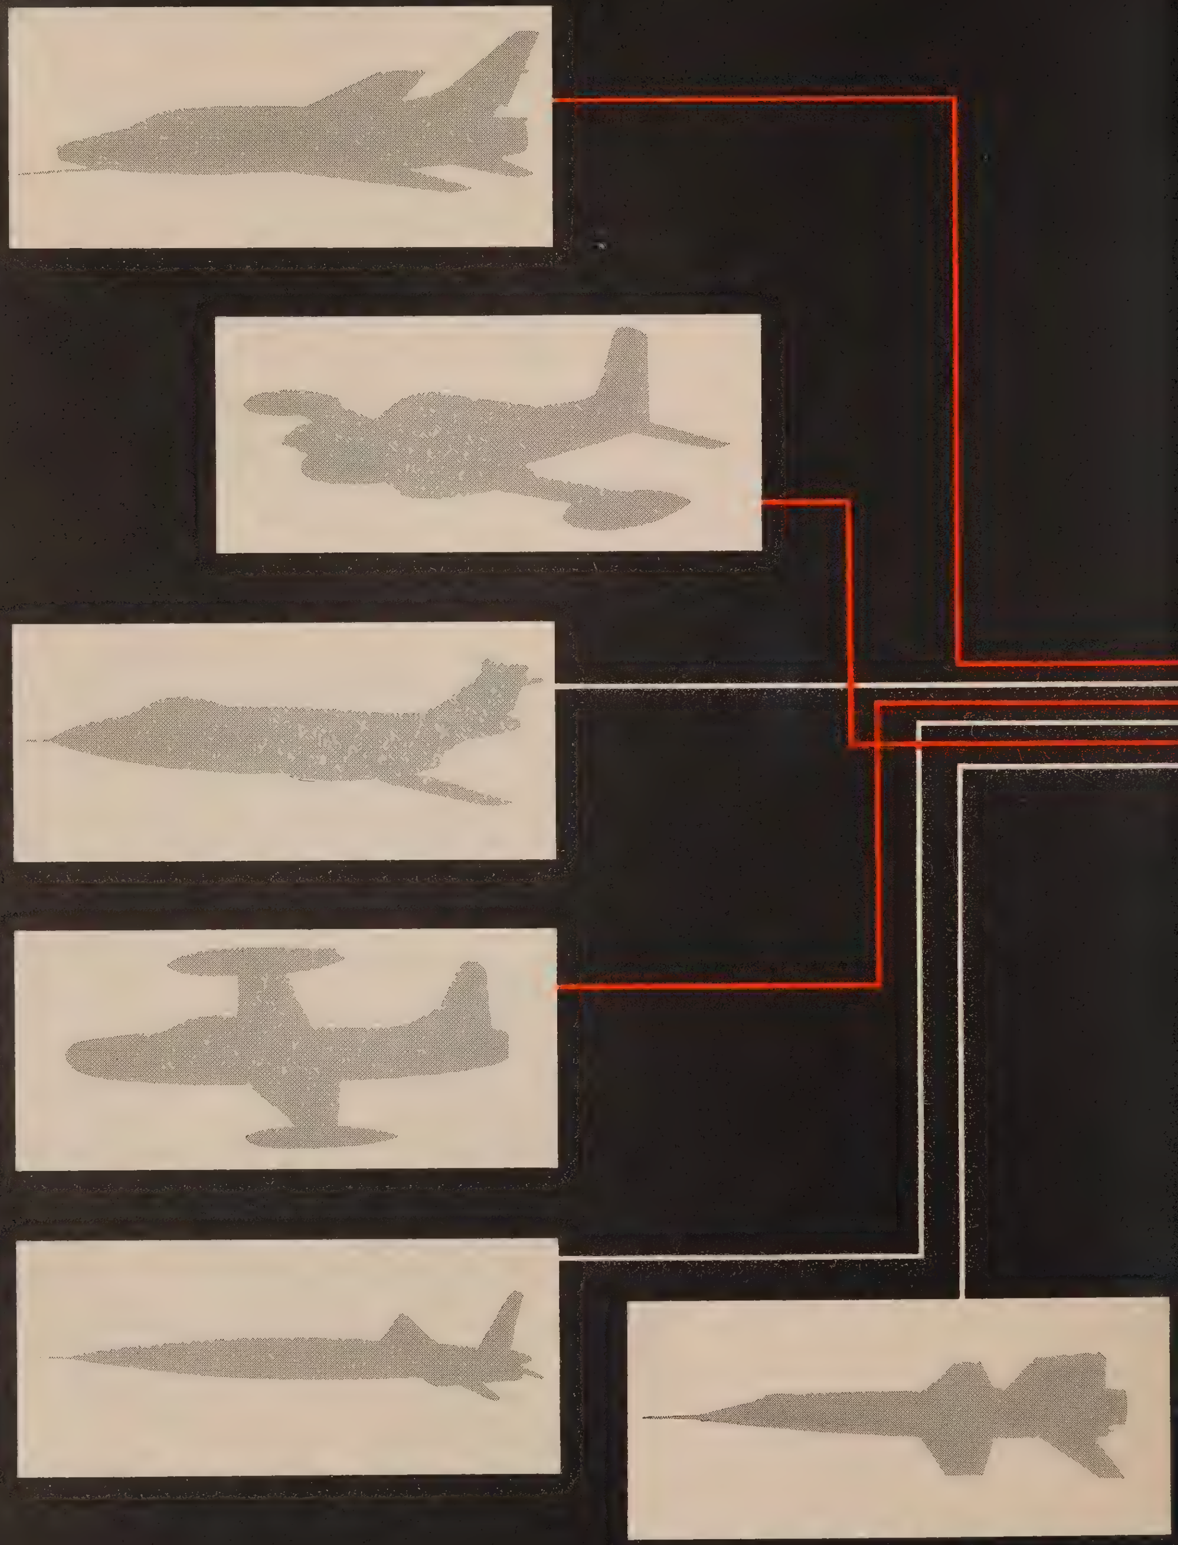
FORECAST

Laboratories for space science at Martin are now studying and forecasting the physical, psychological, and biological factors that will affect man in space...another tremendously fascinating program which attracts persons with exceptional professional abilities. If you have these abilities, you are invited to communicate with N. M. Pagan, (Dept. DD-11) The Martin Company, P. O. Box 179, Denver 1, Colorado.

MARTIN
DENVER



working . . .
with systems that know how to adapt

Like man—Honeywell's Adaptive Autopilot can accommodate, in fact, can adapt. Anthropomorphic? Perhaps—nonetheless, this system has the capacity to change its own parameters through an internal process of measurement, evaluation, and adjustment. It operates independently of air data information and complex gain scheduling—and is unaffected by changes in aerodynamic characteristics. Simply, it adjusts itself in response to its own performance.

Without major modifications, the Adaptive Autopilot can be adapted to air vehicles of all types—from business aircraft, helicopters, drones, supersonic fighters and bombers, and missiles—to the latest hypersonic research vehicles.

Adaptive flight control systems are another example of Honeywell Aeronautical's accomplishments in advanced control. Other developments include electrically suspended gyros, guidance control and environmental control systems, and "decision-making" pre-launch checkers. The division's competence has been demonstrated by contributions to Sergeant, Thor, Atlas, Titan, Polaris, Centaur, Wagtail, F-104, B-58, WS 117L, X-15, F-101, B-66 and WF2. Current expansion has created openings for engineers and scientists in these and similar programs throughout the country and abroad.

living . . .
with people that know how to live

Honeywell engineers and their families find facilities are readily accessible for the things they enjoy.

For the sports minded, the Twin Cities offer Big Ten Football, professional hockey, and in 1961, National League Football. And with its Metropolitan Stadium, one of the country's finest baseball parks, major league baseball seems inevitably near.

Outdoor enthusiasts enjoy this area for its easy access to hunting, fishing, golfing, tennis, swimming, boating—or in winter, skating, skiing, sledding, ice fishing, and ice boating. And the popularity of sailing and yachting is evidenced by the existence of many fine clubs of this type.

Those who appreciate the arts enjoy the Twin Cities as a cultural center . . . listening to the Minneapolis Symphony Orchestra—browsing through the Minneapolis Institute of Art or Walker Art Center—enjoying opera and ballet at Northrup Memorial Auditorium, or legitimate theatre at one of the area's fine playhouses.

These are some of the activities that make this an area for "living." And they're an important part of the life enjoyed by Honeywell engineers and their families.

Inquiries on opportunities with Honeywell Aeronautical will get prompt and confidential attention. Write Mr. James H. Burg, Technical Director, Dept. 662A, Aeronautical Division, 1433 Stinson Blvd. N.E., Minneapolis 13, Minnesota.

Honeywell

H HONEYWELL *Military Products Group*

3-Question Quiz for Senior Level Electronic Engineers and Physicists

(1) Do you enjoy the full measure of creative freedom to which experienced men are entitled?

(2) Do you have a high degree of respect for your top management's technical competence?

(3) What about the projects you're working on—are they stimulating enough to fully challenge your talents?

At General Mills R and D Laboratories in Minneapolis, engineers and physicists answer an enthusiastic "yes" to all these questions.

For nearly two decades we have been developing and manufacturing weapons, sub-systems, and electro-mechanical and electronic instrumentation systems for both military and commercial use. Our growth has been impressive, and it promises to be even more impressive. Right now we have several technical supervisory and purely technical opportunities open to senior level engineers and physicists in the fields of:

- Digital System Configuration
- Electronic Circuit Design
- Micro-wave Development
- Digital Computer Logic
- Electronic Packaging
- Advanced Pulse and Video Circuit Development
- Advanced Inertial Navigational System Development
- Optical and Infra-Red Equipment Engineering

Perhaps you are one of the men we seek. Ideally, you have a graduate degree and 5 to 8 years experience in electronic instrumentation systems development. In any event, if you now hold a technical supervisory position or are capable of doing so, if you have initiative and drive, if you enjoy exploring the unknown in order to find better ways of doing things—we are genuinely interested in you. And you should be interested in us, because we promise you a creative environment in which you can quickly achieve the full measure of professional and personal recognition that your finest talents demand.

You'd like living in Minneapolis—some of the nation's most beautiful fishing, hunting and camping sites are just an hour's drive away. We enjoy a friendly, neighborly way of life and, at the same time, have all the advantages a major cosmopolitan center can offer. Our people spend long evenings with their families because travel to and from work is easy, uncongested. Children grow strong and healthy in this wholesome vacationland. And they're educated in fine, trouble-free schools.

Send today for more information.

(Continued from page 143A)

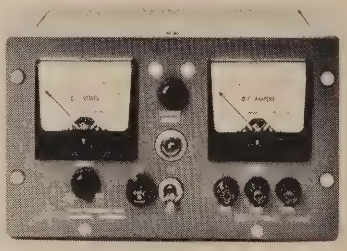
storing 1,000 pounds of propane gas with the generator, it could run unattended for five years, according to General Instrument engineers.

The thermoelectric power plant, which looks like a small cylinder 12 inches high and 12 inches in diameter, has at its center a specially-designed, burner that burns the propane gas at a constant temperature and uses more than 85% of the heat content of the fuel. Surrounding the burner is a metal combustion chamber which captures the heat. Attached to each of the four sides of the combustion chamber are the "thermopiles." The heat not used by the thermopiles is conducted directly to "heat rejection fins" made of aluminum, which form the outer shell of the whole unit and give it a star-like appearance.

The five watts of power produced, it was pointed out, is the same amount of electricity as is used to run the radio on the Pioneer V satellite, sending messages from hundreds of thousands of miles in outer space. It also is the same power as was produced by the experimental SNAP III atomic thermoelectric generator unveiled at the White House in January, 1959. Melvin Barmat, who was Project Manager for the Martin Company on SNAP III, established and heads up the General Instrument Thermoelectric Division and was largely responsible for design and development of the new device.

Dual Range Power Supply

Invar Electronics Corp., 323 W. Washington Blvd., Pasadena, Calif., announces development of a transistorized power supply featuring dual range operation. It is known as the Model TP-36/18 Dual Range Supply.



The Model TP-36/18 provides a front panel switch for selecting either of two ranges of operation. The supply will deliver up to 2 amperes at 0 to 18 volts in the first range; and up to 1 ampere at 0 to 36 volts if operated in the second range.

In either range line regulation is 10 mv, load regulation is 5 mv and ripple is 0.2 mv rms.

Model TP-36/18 also features complete electronic short circuit protection, remote programming and remote sensing.

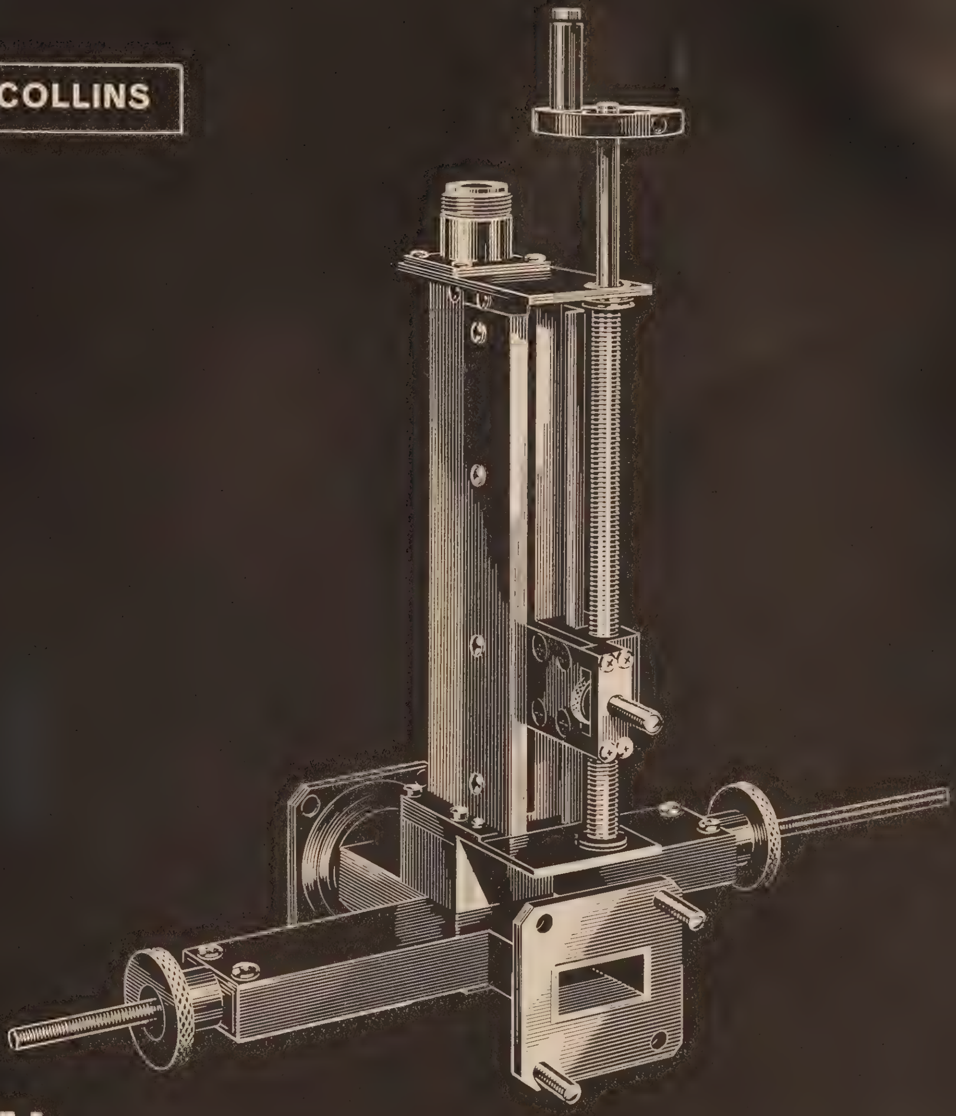
RESEARCH AT COLLINS



THE UNUSUAL SHAPE OF PROGRESS

A company sponsored research program to investigate the operation of parametric amplifiers has resulted in improved communication equipment in the uhf frequency range. Collins engineers decided to attack the problem from the standpoint of circuitry rather than device design, and the two-port uhf parametric amplifier shown above emerged from Collins Research Laboratories. Final development resulted in an amplifier with a gain-bandwidth product more than twice that of previous amplifiers.

In the Advanced Circuits Division of Collins Research Laboratories, physicists, mathematicians and engineers are planning basic research programs in solid state physics. Research in the field of thermoelectric phenomena is now in progress. Other studies are being conducted in this division in the general area of modulation and information theories, and traveling wave principles. To further this work, and to advance scientific knowledge with the resultant development of new technologies in other areas, unique professional opportunities are now being offered by Collins Research Division in radio astronomy, advanced circuits, advanced systems, antennas and propagation, mechanical sciences and mathematics. Your inquiry is invited.

OPPORTUNITIES
IN
IBM
RESEARCH

SERVOS

The IBM Research Center in Westchester County, New York, has an excellent opportunity for a senior electrical engineer with broad theoretical and practical experience in servo controls and servo components. Problems involved in this assignment include control of high-speed tape transports, control of pulse hydraulic circuits, and analysis of nonlinear analog systems.

You should be familiar with basic electrical, mechanical, and hydraulic servos and components, as well as analog circuit systems. You should have a working knowledge of standard linear servo techniques—such as root locus, Nyquist, Bode, Z-transform, and sample-data systems. Familiarity with the latest work being done on nonlinear servos is desirable.

QUALIFICATIONS:

M.S. or Ph.D. in Electrical Engineering plus considerable experience.

You will be working with people who are outstanding in their respective fields. You will be eligible for many liberal employee benefits, including a comprehensive education program. This is an outstanding opportunity to work on interesting and challenging research problems.

For details, please write, outlining your background and interests, to:

Mr. K. J. Turner

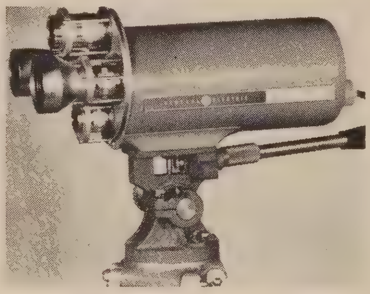
Closed Circuit TV Camera

General Electric Co., Technical Products Operation, Communication Products Dept., Electronic Park, Syracuse, N. Y.

Applications for the TE-9-A include the military, industrial and educational fields



Enclosed in a rugged, dust-tight housing the Vidicon unit successfully passed a series of tests in which it was mounted close to several rocket engines.

In all cases, the camera performed continuously with consistent picture quality and withstood the shock and noise without any additional special protective housing. In one test, it was mounted eight feet from the engine in an ambient noise environment in excess of 190 db.

Cylindrical in design, the camera is 110 inches long, has a diameter of 50 inches and weighs nine pounds.

The camera will use virtually any standard 16 mm lens and is equipped with a remote turret for mounting four lenses at one time.

Remote optical focus, turret and iris accessories are available, and drive mechanisms are enclosed in the camera.

Other accessories include a remote zoom lens, small pan and tilt, large pan and tilt, remote control unit and remote douser.

The TE-9-A achieves high picture quality—Horizontal resolution is 650 lines, which is considerably above broadcast studio requirements. It will operate effectively at extremely low light level.

The camera's low power operation—achieved through extensive use of transistors—makes ventilation unnecessary. Power input is 18 watts. The camera provides a 1.0-volt composite video output to any monitor. In scanning, it uses 525 lines, 2:1 interlace and 60 cps field rate. The TE-9-A has maximum sensitivity and

can be used down to 1.0-foot candle scene illumination. It operates over 80°C temperature range.

The cover is removed by loosening two captive fasteners and sliding it off the rear of the unit. This exposes the component side of all chassis and permits circuit checking at the component eyelets. Circuitry uses only one tube. The main power fuse is accessible at the rear bottom.

Silicon Alloy Transistors

Western Transistor Corp., 13021 S. Budlong Ave., Gardena, Calif., revealed development and production of a new series of P-N-P silicon alloy transistors, carrying the trade name "WesTran." The '327' series is designed for switching and general purpose application at low and medium power levels. They are suited for use in audio, servo, and dc amplifiers.

The series has been engineered to exceed Mil Spec T-19500, in that they are more structurally rigid than required in such environmental conditions as acceleration, shock, impact, and thermal fatigue.

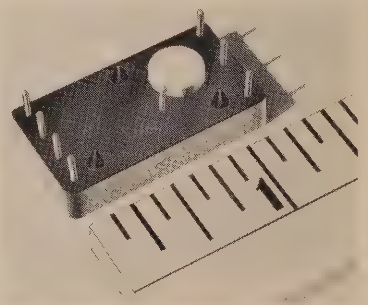
WesTran's facilities were established in January this year, located in a growing industrial suburb of Los Angeles. Their output will shortly reach several thousand units per day. Initial deliveries in quantity were scheduled for April 15. Plans for the near future include introduction of a new high frequency double diffused transistor (mesa), to be produced by early summer.

President and General Manager Charles Prawdzik formerly headed transistor product engineering at Hughes Products, Semi-Conductor Division.

Data brochure 2N327A will be sent on request.

Logic Circuit Unit

A new balanced resistor network designated the SPR-76, which measures only $1\frac{1}{4} \times \frac{11}{16} \times \frac{1}{4}$ is available from **Dale Products, Inc.,** Columbus, Nebraska. The network contains five precision wire wound resistors and one transistor incorporated into a NOR logic circuit.



The complete circuit is encapsulated in a rigid epoxy compound. The network is

* The acceptance by business and industry of the Philco 2000 All-Transistor Data Processing System has created a number of significant advancement opportunities in our organization both at our new headquarters in suburban Philadelphia and at various key locations in other parts of the nation. You are invited to call, write or visit us to discuss your future in our growth organization.

We have immediate assignments awaiting:

ENGINEERING PERSONNEL

Circuit Designers—Opportunities for experienced engineers at Senior, Project and Specialist levels to work in advanced electronic circuitry for digital computer core and drum memory elements.

Product Engineers — Qualified by experience in electronic computer test and debugging for final product evaluation and acceptance of large-scale, high speed all-transistor digital computer system.

Programmers — Mathematicians and Physicists experienced in the elements of sophisticated automatic programming systems to develop efficient, logical programs for control computers.

SALES & MARKETING MEN

Sales Representatives — Experienced in actual sales, installation and servicing of engineering and business data processing systems in major industrial concerns.

Systems Analysts—Degree required, with 5 years' experience in the analysis of Engineering, Scientific, business data processing and military problems.

Programmers — Experienced computer programmers in any of the following fields: Sophisticated Automatic programming systems • Engineering & Scientific Problems • Business, Industrial & Financial Applications • Military Tactical & Logistical Applications.

Customer Service Engineers

Experienced computer engineers for local and out-of-State assignments in major metropolitan areas to install, start up and maintain large-scale, high speed digital computer systems. Advanced training on all-transistor equipment furnished prior to assignment. Also openings for instructors and technical writers with experience in the computer field.

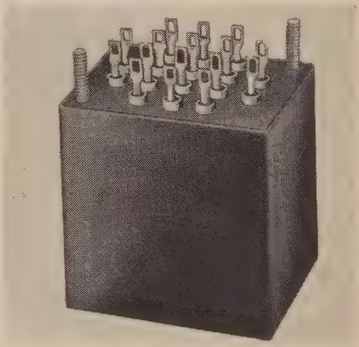
designed to withstand tough moisture, temperature cycling, vibration and life tests. Termination is ideal for printed circuit or plug mounting.

For further information on the SPR-76 and other precision networks, write to the firm.

Magnetic Modulator

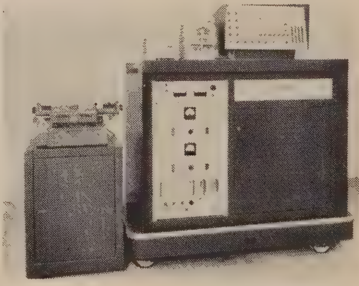


This unit is essentially a low-power level magnetic amplifier. The modulator shown has an input of 115 volts at 400 cps and an output of from 0 to 3 volts and 0 to 2.5 volts with a reversible phase. The dc signal input is 0 to ±100 microamperes, with a 20% maximum distortion of output. The load of this unit is 12,000 ohms.

For further information on this and other magnetic modulators write to **Freed Transformer Co., Inc.,** 1718 Weirfield St., Brooklyn (Ridgewood) 27, N. Y.

Data Logger System

A new Data Logger system that automatically balances from one to 1000 bridges and logs their millivolt output signals in a programmed mode has been developed by **Consolidated Systems Corp.,** a subsidiary of CEC/Bell & Howell, 360 Sierra Madre Villa, Pasadena, Calif.



The system samples 210 channels of analog data per minute sequentially, commutates and converts them, and punches tabulated data in a paper tape at the rate of 60 five-digit characters per second. The punched tape can be input to an off-line printer.

(Continued on page 154A)

Minuteman

...Another major USAF weapon system in development

Minuteman, a three-stage solid propellant intercontinental missile, is moving through its early development and test programs on or ahead of the time schedule originally set for it. This advanced ICBM, the fourth in a family of four Air Force ballistic missiles, is designed to be fired automatically from underground silos or mobile launchers. Minuteman will be constantly at "ready" giving America an almost instantaneous retaliatory capability for defense • The Minuteman concept developed early in 1957 when Space Technology Laboratories conducted a study of the characteristics of second-generation missiles to satisfy the requirements of the Air Force Ballistic Missile Division. STL provides over-all systems engineering and technical direction for Minuteman as it has for the Atlas, Titan, and Thor programs. The application of compatible components, systems, and experience developed through the years is bringing Minuteman closer to the threshold of operational capability • Among the industrial organizations developing Minuteman are such major contractors as: Boeing Airplane Company for assembly and test; Thiokol Chemical Corp., Aerojet General Corp., and Hercules Powder Company for engines; Autonetics, a Divisionof North American Aviation for guidance; and Avco Corp. for re-entry vehicle.

To assure continued growth in these and related space programs, STL is already projecting state-of-the-art advances five and ten years ahead. Outstanding scientists and engineers with unusual capabilities in propulsion, electronics, thermodynamics, aerodynamics, structures, astrophysics, computer technology, and other related fields and disciplines are invited to investigate positions at STL. Please send resumes to:

INERTIAL SYSTEMS DEVELOPMENT

..... there are opportunities at Honeywell Aero for the engineer or scientist who is interested in participating in this growing field of technology. While specific inertial systems experience is desirable, you may also be qualified by your background and/or related experience for activities in the inertial systems development at this time. Specific openings include:

SYSTEMS ANALYST

Mathematician or engineer with strong background in vector analysis, operational calculus, matrix algebra and related techniques. To carry out analysis of inertial systems configurations including error evaluation.

DIGITAL SYSTEMS AND LOGIC DESIGNER

Familiar with digital logic techniques at current state of the art; capable of organizing computing systems to perform various tasks including logical design and critical parameter specification.

ELECTRONIC ENGINEER

Electrical engineering degree plus experience in miniaturized semiconductor electronics development. To design servo, pickoff, and other electronics for use with gyros and accelerometers.

ENGINEERING PHYSICIST

Physicist with practical and theoretical understanding of mechanics, magnetism and electricity to analyze and develop inertial sensors of novel and original design.

To discuss these or other openings, write Mr. R. O. Maze, Chief Engineer, Marine Systems Group, Dept. 662C. Aeronautical Division, 1433 Stinson Blvd., Minneapolis 13, Minn.

(Continued from page 152A)

All necessary equipment for sampling, amplifying, commutating, digitizing, and punching paper tape is in an integral cabinet.

Although the system can accept any quasistatic signal from zero to 500 millivolts, such as from thermocouples or potentiometers, because of its automatic bridge balancing feature it is recommended for use where 100 or more bridges are used in static testing. An actual application is static testing of aircraft scale models.

The balance mode is programmed with a punched paper tape. During operation in the balancing mode, the system automatically balances the bridges by switching across each bridge a graduated set of precision resistors, and punches the amount of offset onto a second paper tape, called the "run tape." Also punched onto this tape are such calibration and program data as channel selection, selectivity and zero offset. Channels can be omitted or balanced in any sequence, making it possible to repeat channels carrying rapidly changing data during the "run" mode.

Sensitivity control is in increments of 0.01%, for a total of 10,000 increments. These can be directly correlated for a linear scale factor by depressing selected pushbuttons representing four digits to 9999. Sample reading is then in engineering units.

Accuracy of ±0.15% full scale and resolution of five microvolts are built into the system.

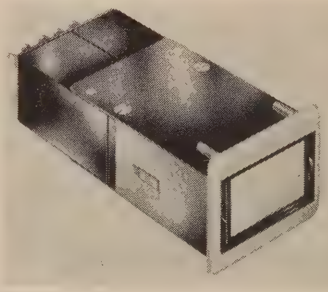
Magnetic Amplifiers

PREAC
AMPLIFIER
AIRPAX
TYPE M-5851-C
FORT LAUDERDALE, FLA.

With thermocouple, strain gauge, photocell or other low level inputs, these 400 cps amplifiers can deliver 0 to ±5 volts output into a 50 K load at accuracies of 0.1% in a single stage of amplification. Series 5800 PREAC magnetic amplifiers are built by **Airpax Electronics, Inc., Seminole Div.,** Fort Lauderdale, Fla. They feature a built in temperature compensation, a filtered output and inherent high gain and reliability. These dc amplifiers are applicable to ground multi-channel data amplification and airborne instrumentation and are employed as highly reliable and flexible building blocks in instrumentation and control systems. Applications also include linear amplification, null and error detection, summing with electrical isolation, integrating, micro-volt and microampere measurement.

Switch Light

A switch light which rebulbs from the front without use of tools, features all terminals at back of the assembly, and can use 115V ac to operate AN-3140-327 bulbs in its small package is available from **Master Specialties Co.,** 956 E. 108th St., Los Angeles 59, Calif. Lamp and switch circuits are independently operated.



The lens area can be subdivided into four segments. Units are easily wired, and mount flush. Units and switches qualified per Mil. Specs. Positive tactile sensation on activation. Solid shake-proof mounting with impact resistant construction. Bulbs remain stationary during switching. Light intensity is bright and uniform. Units can include components for diode test. They may be grouped with standard Roto-Tellite^{R} units. Ambient temperature range is −65°F to +160°F.

Solid State Power Supply Modules

The Model PS 202, an inexpensive, compact dc supply with dual output up to 150 milliamperes at ±18 volts or a single output at ±36 volts, is available from **Solidyne,** 7640 La Jolla, Calif.

Line and load regulation is ±1% with less than 6 millivolts of ripple. This 8″×3″×3″ unit weighs 2 pounds and is convenient for bench work as well as the building block of transistor equipment.

Model PS 206 is primarily used where a dc reference source is required. Line regulation from 95 to 135 volts ac input is 0.1% with continuously variable dc output of 2 to 24 volts. Load regulation is 0.1% with loading of 0 to 100 milliamps. Temperature stability is 50 parts per million/°F in the range of 40 to 120°F. Line-Load isolation

YOUR IDEA MAY BE BOEING / WICHITA'S PRINCIPAL FUTURE PRODUCT!

If you're the kind of man with a truly inventive turn of mind . . . if you have really big ideas about end products and processes . . . if you can sense the challenge in joining one of the world's largest companies at the beginning of an expansion and diversification push . . .

YOU BELONG WITH BOEING / WICHITA Here's why: We have started the most ambitious product development program in our history. As you probably know, the tools are already here. Boeing / Wichita is one of the most extensive design and manufacturing complexes ever put together . . . with test facilities to match.

We're looking for the kind of brains and vision that can activate meaningful programs in New Product Design. We're looking for the few men whose original thinking today will be translated into the products of an advanced age tomorrow. The rewards will be great. In terms of challenge, nothing can surpass it. Materially, basic compensation will be excellent . . . and Boeing's well-known royalty plan is spelled out in black and white.

Naturally, the qualifications are high. But if you are one of the few who fits them . . . by education, experience, inherent ability, or a combination of these . . . you will probably know it instinctively. We invite you to write in confidence to Mr. Melvin Vobach, Dept. H6, Boeing Airplane Co., Wichita 1, Kansas.

BOEING / WICHITA

CAREER OPPORTUNITIES WITH BAUSCH & LOMB

Section Head, Electronic Engineering

7 to 10 years experience, with design capabilities in circuits, controls, servos, feedbacks, etc.

Physicists

- Ph.D. or equivalent; creative development of optical electronic measuring systems.
- Experience in spectroscopy and electronics.

Electronic Engineers

- Senior designer, circuit capabilities, supervisory experience.
- Experience in acoustics or tape recorder engineering.
- Experience in circuit design and development of servo-mechanisms.
- Experience in scientific instrument design.
- Experience in design of photo-electric measuring systems.

Reply, with resume, to Mr. Ellis P. Faro, Employment Manager, Bausch & Lomb, 635 St. Paul St., Rochester 2, N.Y.

is in excess of 10k megohms. Module dimensions are 7.5×3.5×2.5″. Model PS 206 finds application in the strain-gauge instrumentation field.

New Literature

A four-page application note describing the use of the Moseley Model 60B Logarithmic Converter as a computing element is now available from the company.

The note explains how the 60B, when used in pairs and with a suitable read-out device, can readily perform multiplication and division. Any read-out device may be used, provided the complete load impedance agrees with the values presented in the application note's diagrams and tables.

The application note, AN-101, may be obtained by writing the **F. L. Moseley Co.,** 409 North Fair Oaks Ave., Pasadena, Calif.

Portable Temperature Chamber

A precision temperature test chamber capable of accommodating rack-mounted electronic equipment has been announced by **Delta Design, Inc.,** 7460 Girard Ave., La Jolla, Calif. Prolonged temperature runs with stability to within ½°F over the range −100°F to +500°F can be economically made.

Described as Model 7000A, the chamber has an internal test volume of 19½×11 ×15 inches, easily handling the 19-inch standard rack unit. Model 7000A attains its high degree of temperature stability through the use of a thermocouple and a precision meter-relay.

With an auxiliary timer-control unit, Model 7000A can be pre-set for automatic hot-cold cycling at alternate temperature levels throughout the chamber's—100° to 500° F range. The auxiliary timer is available as optional equipment. The chamber control is not subject to drift due to line voltage variations even on prolonged runs.

The aluminum cabinet of the Model 7000A is finished in gray wrinkle enamel; the interior is of stainless steel. Liquid CO_2 is used for cooling. The chamber is supplied with a Pyrex window for visual observation, and a large access port accommodates all feed-through connections.

CLEVITE

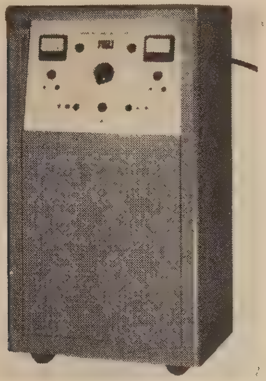
BOONTON RADIO CORP.
BOONTON, N.J. DEERFIELD 4-3200

D3 Power Supply

A new dc power supply delivering 200 ma at 25 kv for experimental and industrial applications is announced by **Del Electronics Corp.,** 521 Homestead Ave., Mount Vernon, N. Y.



Model PSC 25-200-2 is designed for 208 volt, 3-phase 60 cps operation. Incorporated are several outstanding safety features: no exposed high voltage components; zero-start interlock; over-voltage and overcurrent relays; fully adjustable voltage output on front panel; completely self-contained—all high voltage components immersed in tank of high grade insulating oil; push button "on-off" controls.

Descriptive material on Model #25-200-2 can be obtained by writing to the manufacturer.

Transistorized Instruments

A complete line of transistorized regulated power supplies, dc-dc voltage regulators and a transistor checker is announced by **Valor Instruments, Inc.,** 13214 Crenshaw Blvd., Gardena, Calif. All are designed for transistor circuit applications and are explained with applications, specifications and prices in catalogue SF 1259.

Fifteen power supplies with outputs of 1.5–50 vdc and 0–5 amperes, four voltage regulators with outputs ranging from 6–35 vdc and inputs 24–45 dvc plus a transistor checker designed for fast (10 second) tests are fully explained.

Panel Meter Bulletin

The "Big Look" In Small Panel Meters—Bulletin GEA-7034, 12 pages, four colors, offers complete descriptive and buying information on General Electric's line of 2½-, 3½-, and 4½-inch "Big Look" panel meters. Includes a detailed description of product features and specifications, plus dimensions, prices, and ordering instructions for all available instruments. A description of custom features for special applications is also included. **General Electric Company,** Schenectady 5, N. Y.

Rack and Panel Connectors

A new Series DTD Rack and Panel Connectors is being announced by **H. H. Buggie Div., Burndy Corp.,** P. O. Box 817,

ACF ELECTRONICS DIVISION
ELECTRO-PHYSICS LABORATORIES

Responsible assignments in furthering the state-of-the-art of Ionospheric Physics, combining competitive salaries and unusual growth potential, are offered to men who can contribute. Our present needs are for:

Physicists
Electronic Engineers
Field Station Engineers

FOR RESEARCH PROGRAMS IN
IONOSPHERIC PROPAGATION
& HF COMMUNICATIONS

SENIOR IONOSPHERIC PHYSICISTS

Ph.D. preferred, with several years' experience in the study of Ionospheric phenomena. Should be familiar with present knowledge of upper atmosphere physics and possess an understanding of current programs using rockets and satellites for studies in F-region and beyond. Qualified individuals with supervisory abilities will have an exceptional opportunity to assume project leadership duties on HF projects already under way involving F-layer propagation studies backed by a substantial experimental program.

SENIOR DEVELOPMENT ENGINEERS

Advanced degree in E.E. or Physics preferred. Must be familiar with present state-of-the-art in the design of advanced HF receivers and transmitters and possess working knowledge of modern HF networks employing ferrites and metallic tape cores. Strong theoretical background in modern linear circuit theory desired. Will carry out laboratory development and implementation of new HF communication systems.

SENIOR ELECTRONIC ENGINEERS

Advanced degree in E.E. preferred. Must be familiar with conventional pulse circuit designs and applications. Technical background should include substantial experience in data process and data recovery systems using both analog and digital techniques. Knowledge of principles and application of modern information theory including correlation techniques helpful. Will be responsible for the design of sub-systems.

JUNIOR ELECTRONIC ENGINEERS

To assist Senior Engineers and Scientists in the development of HF communications and data process equipment. Should have formal electronics schooling and 2 years' experience in circuit design, checkout or analysis of HF communications, Radar Pulse, Analog/Digital or Data Recovery equipment. Construction of prototypes of new and interesting equipment and design of individual components of communications and data processing systems will comprise the major efforts of selected applicants.

FIELD STATION ENGINEERS

B.S.E.E. or equivalent, consisting of combined civilian or military technical school, with work experience. Presently employed as a field engineer or project engineer with valid 1st or 2nd Class FCC license and a good command of some of the following: Radar, preferably high power; HF long-distance communications systems; Tropospheric or Ionospheric scatter systems. Must be willing to accept assignments in areas where dependents are not permitted for periods of up to one year. Differential paid for overseas assignments.

The Electro-Physics Laboratories are located in the suburban Washington, D.C. area, where post-graduate study is available in several nearby universities. Housing is plentiful in attractive, well-established neighborhoods. Our relocation allowance is liberal.

All inquiries will be held in strictest confidence and answered promptly.
Please send resume to:

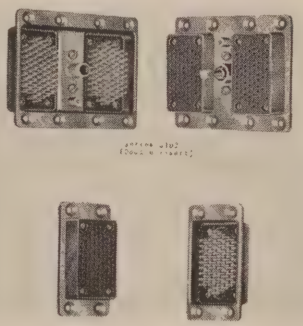
THE SINGER MANUFACTURING CO.

These manufacturers have invited PROCEEDINGS readers to write for literature and further technical information. Please mention your IRE affiliation.

(Continued from page 157A)

Toledo 1, Ohio, for military, commercial and industrial equipment application.



Series DTD is being offered with single or double inserts mounted in a die-cast aluminum alloy shell. The compact design permits a large number of contacts in a small area. At the present time, tooling has been completed on the 50 and 78 contact inserts, making available for immediate production connectors with 50, 78, 100 and 156 contacts, or combinations of these inserts. Other standard insert arrangements are being tooled and will be announced to the industry as completed.

An advantage of the Buggie Series DTD connectors is that either male or female inserts are interchangeable in the field as a sub-assembly. The insulating material for the inserts is Melamine. It provides a rigid insert and meets Military Specification MIL-M-14E, Type GMG. Contacts are brass (pin) and phosphor bronze (socket). Silver and/or gold plating is provided.

The double insert Series DTD2 utilizes a screw fastener for quick engagement and disengagement. This fastener can be furnished with wing or Allen head. Also, connectors will be furnished without an engagement device.

The company has available a catalog specification sheet giving complete description and dimensional data for design-specification engineers.

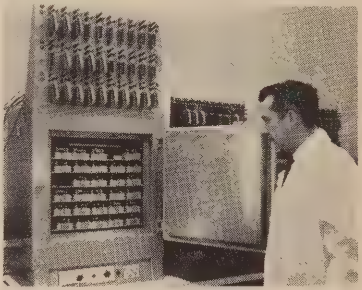
Range Converter For Recorder

A new 4-page Data Sheet NY2(1) "Speedomax H Range Conversion," available from **Leeds & Northrup Co.,** 4934 Stenton Ave., Philadelphia 44, Pa., provides a guide to selecting the necessary components—scale, chart, circuit panel, etc.—to change the range of any standard Speedomax H instrument.

A master table on the sheet lists the basic items required to change range (1) for the same type of primary element, or (2) from one type of primary element to another (e.g., thermocouple to Rayotube detector). Individual tables list the specific part numbers of scales, charts, etc. for each type of range. Wiring diagrams to simplify electrical connections are also listed.

Component Life-Test Oven

A new elevated-temperature thermostatically controlled life-test oven with complete internal power-supply and test-facility circuitry has been introduced by **International Telephone and Telegraph Corp., Components Div.,** 815 San Antonio Rd., Palo Alto, Calif. The new unit handles 660 bipolar components or 330 tri-polar devices. Standard units are rated at 125°C maximum.



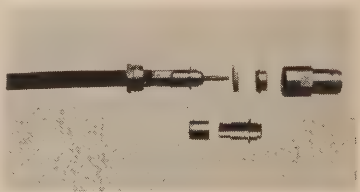
Components are carried in low-resistance electrical clips on mounting racks of expanded metal. These have self-mating connectors on their rear surfaces and the related circuitry permits either connection of all racks to a common power supply or each to an individual one.

This Teflon-insulated wiring terminates in a patch panel above the oven, by means of which electrical checking of the components under test can be performed externally without disturbing the internal temperature by opening the oven. Test circuitry is rated at 750 volts and 5 amperes with resistance less than 0.5 ohm.

Power requirements are 1600 watts at 115 or 230 volts and 50 or 60 cps. Weight is 250 lb. Prices start at approximately $4,000.

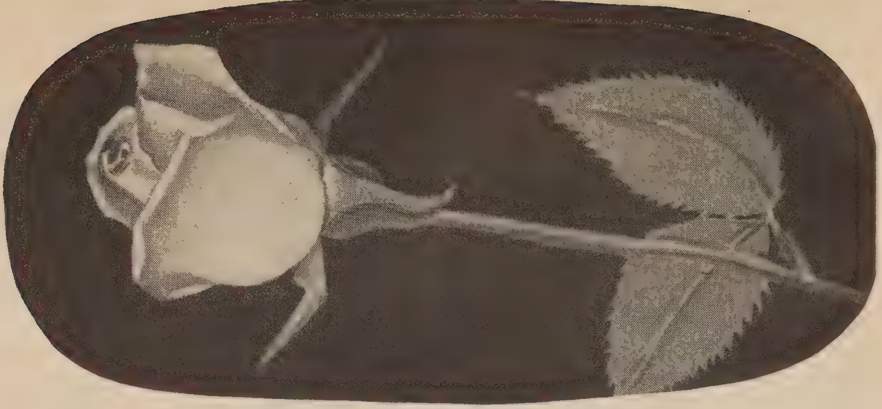
Coax Connector Attaching Device

A new method for attaching RF connectors to coaxial cable is now manufactured and available from **Kings Electronics Co., Inc.,** 40 Marbledale Rd., Tuckahoe, N. Y., under license from Douglas Aircraft Corp. This method embodies the use of Kings' K-GRIP and offers many features not to be found in conventional connectors.



K-GRIP connectors have several advantages. Connector parts can be readily removed for inspection or replacement in the field without disturbing or impairing the electrical characteristics of the cable assembly. Both the cable braid and the dielectric are firmly held by the device resulting in a stronger connection. K-GRIP eliminates the need for a captive contact. These grips for Type RG-8/U cable can be

(Continued on page 160A)



At Bendix York, we have a number of immediate openings for Electronic Engineers and Physicists.

There are many worthwhile advantages awaiting the Professional Engineer who chooses to advance his career with us at Bendix York.

A white rose . . .

The white rose is a symbol at Bendix York . . . a symbol with two meanings. Both of vital importance to *your* future.

First, the white rose is the official flower of York, Pennsylvania. It is a symbol of the good life in our dynamic community, located in the heart of the scenic Pennsylvania Dutch region. It is a wholesome, happy area with excellent schools, delightful recreational opportunities and many cultural advantages. Here—away from high-pressure, high-cost, big-city living—you will enjoy the fuller, more rewarding life that you want for yourself and for your family.

Second, the white rose is a symbol of perfection . . . the perfection for which we strive at Bendix York—perfection in the engineering and scientific pioneering and development in missile electronics that is our principal objective.

We offer a small Division's assurance of individual recognition and advancement, and yet you have the security and employee benefits of a large corporation.

We would like to have the opportunity to tell you more about Bendix® York. We invite you to contact us—by dropping us a post card, by giving us a call or, if you will, by sending us a brief resume. Address Professional Employment: Dept. P

AERONUTRONIC a Division of Ford Motor Company
has immediate openings in
ELECTRONICS ACTIVITY OF
TACTICAL WEAPON SYSTEMS OPERATIONS
for ELECTRONICS ENGINEERS

TO WORK IN
- IR Development
- Instrumentation Development
- Transistor Circuit Development
- Electronic Systems

Immediate expansion of new and existing programs is creating outstanding opportunities in R&D and PRODUCTION on advanced programs such as:

- **Shillelagh, surface-to-surface tactical missile**
- **Air Cushion Vehicles**
- **Anti-submarine Warfare**
- **Air-to-surface tactical weapons**

Positions are at interim facilities in Santa Ana near Aeronutronic's new $22 million Engineering and Research Center now being completed at Newport Beach, Southern California—the West's most ideal location for living, working and year 'round recreation.

Experienced engineers with demonstrated ability are invited to share in research and development work—work that is challenging and stimulating as well as exceptionally rewarding.
Send inquiries and resumes to Mr. John Starbuck, Dept. 29

PHYSICIST
ADVANCE DEVELOPMENT OF SEMICONDUCTOR DEVICES

PhD, MS or equivalent with a background in solid state physics or electronics to analyze the operation of high frequency devices leading to the development of new device structures.

WRITE: M. D. Chilcote, Div. P-6
Semiconductor Products Dept.
Electronics Park, Syracuse, New York

GENERAL ELECTRIC

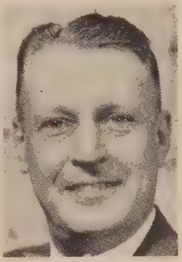
These manufacturers have invited PROCEEDINGS readers to write for literature and further technical information. Please mention your IRE affiliation.

(Continued from page 158A)

used with over 50 standard RF connectors. K-GRIP connectors are also available for other standard cable sizes. Assembly is accomplished by means of a readily available inexpensive Thomas & Betts tool. Attaching time of connector to cable is reduced. Soldering may be eliminated on connectors which have brass center contacts because the center contact may be crimped to the cable's center conductor by the same tool.

Super-Temp Names Two V.P.'s

Leroy Tourville, President of **American Super-Temperature Wires, Inc.,** of Winooski, Vermont today announced the appointment of Richard D. Hoyt as Vice President in charge of Sales and Oakley F. Hoyt as Vice President in charge of Market Research and Advertising. The Hoyts, residents of Princeton, N. J., have jointly supervised sales for the company since it was organized in 1955 and have served in engineering capacities as well. In 1958, Super-Temp became a subsidiary of Haveg Industries of Wilmington, Delaware.



O. F. Hoyt

R. D. Hoyt

Both Hoyts have been engaged in the industry for over twenty years, and, during the past decade they have specialized in high temperature wires, employing TEFLON, Silicone Rubber, etc., as insulating compounds.

Richard Hoyt, in his new position, will continue to promote the Super-Temp line on a national basis while Oakley Hoyt will be engaged in the investigation of new product possibilities and broadening the application of the company's present high temperature wire line in the military, industrial and consumer fields.

The Hoyts will continue to operate from the Sales Office at 195 Nassau St., Princeton, N. J.

Hermetic Seals Catalog

A new catalog 1259 which lists basic types of precision hermetic seals which are regularly available for evacuated or pressurized enclosures, is available from **Dage Electric Co., Inc.,** Beech Grove, Indiana. Each type of seal is clearly illustrated and

PRELIMINARY DEVELOPMENT

SENIOR ENGINEERING SPECIALISTS

Honeywell Aero Preliminary Development Staff has several openings for technically qualified and mature engineers with significant military system development experience. Each man will provide guidance and support in his specialty to Honeywell design projects for the best use of advanced techniques in development of new airborne systems. These staff positions offer scope for original personal contributions and will require active participation in the formulation and execution of Division engineering programs. Among the openings are:

WEAPON DELIVERY AND CONTROL SYSTEMS SPECIALIST

Background of system and computer development for bombing, fire control, or navigation. Firsthand experience with system analysis, tie-in requirements, analog and digital computers, operations analysis, and weapon effectiveness evaluation.

DETECTION SYSTEMS SPECIALIST

Primary background of airborne radar development in one or more areas such as AMTI, Doppler, pulse Doppler, automatic tracking, and countermeasures. Experience in infrared or communications will be valuable. Experience should include system analysis, design requirements, equipment development, and performance evaluation.

ELECTRONIC CIRCUIT AND PACKAGING SPECIALIST

Background of circuit design for advanced control and computation equipment. Should be familiar with dc, low frequency, pulse and rf techniques. Must be able to establish sound analytical basis for circuit design to specific levels of reliability and performance. Must be experienced with solid state devices and prepared to contribute to Aero Division work on microcircuit techniques.

To discuss openings for these and other specialties, write or phone Mr. J. R. Rogers, Chief Engineer, Preliminary Development Staff, Dept. 662E, Aeronautical Division, 1433 Stinson Blvd., Minneapolis 13, Minn.

Honeywell

Military Products Group

To explore professional opportunities in other Honeywell operations coast to coast, send your application in confidence to H. K. Eckstrom, Honeywell, Minneapolis 8, Minnesota.

(Continued from page 160A)

listings give complete dimensional specifications.

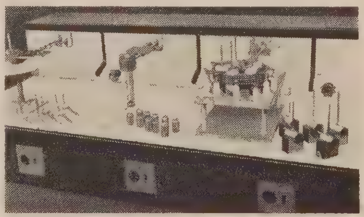
DAGE
ELECTRIC COMPANY INC

A special section gives latest accepted glass seal nomenclature. To assist the designer who requires custom-made seals, the 28-page catalog also covers general manufacturing techniques and usage recommendations. Dage precision hermetic seals are tested to insure unit integrity with respect to moisture, corrosion, extreme pressures, vibration and rare atmospheres.

Copies of the new Dage catalog 1259 may be obtained fron Dage representatives or by writing.

Induction Heating Work Tables

Lepel High Frequency Laboratories, Inc., 55th St. and 37th Ave., Woodside, N. Y., has developed a line of multiple position work tables with built-in power transfer switches for numerous induction heating applications such as; soldering, brazing, bombarding and heat treating.



In the accompanying illustration, the set-up on the left shows a five piece assembly being soldered in one open end coil using pre-formed solder rings; in the center of the table, tungsten contacts are being brazed to brass bodies using silver solder; and on the right, five copper and brass assemblies are being soldered within one heating coil. The three-position work table is powered by a single induction heating generator, which can be switched from one working station to another.

It is ideal for applications that are frequently used. The outstanding feature is the advantage of leaving the operating set-up as is, proceeding to the next application, then returning to the original set-up without loss of time. The work table is equipped with pilot lights to indicate the station being powered. Each station can be operated by a push-button, footswitch or timer. These work tables can also be built with quench tanks for heat treating applications.

Circular Waveguides

Simple and complex bends in millimeter-band circular waveguide are now being fabricated, as the result of a newly developed method of waveguide construction by **TRG, Inc., Antenna and Microwave Dept.,** 9 Union Square, Somerville 43, Mass. The bends are made by first corrugating the inside of lengths of straight copper waveguide and then bending them to the desired shape.

The new method of construction was developed to make use of the TE_{01} mode in circular waveguide, preferred because of its circular symmetry and low loss. The corrugations overcome the problem of deviations from straightness, and the resultant mode conversion to the degenerate TE_{11} mode. In addition, the new method allows complicated bends to be made with little or no machining.

A typical 90° bend made with the new method, Model V-BMM 1, has a three-inch inside radius. The waveguide inside diameter is 0.353 inches. The loss in this particular section is less than 0.2 db. Bends at angles other than 90°, or simultaneous bends in two dimensions are also available.

An illustrated catalogue with complete specifications on waveguide bends and other new millimeter-wave components is available from the manufacturer.

Bendix Appoints Umstead and Connaughton

Red Bank Division of the Bendix Aviation Corp. has recently appointed Dwight L. Umstead, Jr., and William Connaughton, Jr. as Sales Engineers for the Electron Tube Products department. Umstead will be working out of the West Coast office at 117 East Providencia Ave., Burbank, Calif., telephone Victoria 9-3961, and will be servicing in conjunction with Eugene W. Swenarton the states of Washington, Oregon, Idaho, California, Nevada, Utah and Arizona.*i*

Connaughton will be temporarily working out of 17 Ruxton Road, Mattapan, Mass., telephone CU 6-1694, and will be covering the New England states of Maine, New Hampshire, Vermont, Massachusetts, Connecticut and Rhode Island. A permanent New England office address will be announced at a later date.

ACF ELECTRONICS DIVISION ELECTRO-PHYSICS LABORATORIES

OUR NEW NAME REFLECTS . . . . . . the ever-growing importance of this unit of ACF—a major, multi-division organization . . . the bringing together of our talents into a highly-regarded, cohesive force in Electronics . . . the expansion of activities simultaneously in a number of broad areas of research, design and development, in modern new facilities.

TO THE ENGINEER, IT MEANS . . . . . . diversification, with choice assignments in the fields of RF Communications Systems, Digital Data Processing Systems and Data Transmission Systems . . . and identification of your contributions to challenging projects of unusual interest.

OUR IMMEDIATE NEEDS ARE FOR:

Research Consultants . . . PhD or MSEE degree, with up to 5 years' experience including background in data transmission, solid-state electronics, data systems development, and systems and circuit design.

—Advanced degree in EE, with experience in communications packaging, including: micro-miniaturization, thin-film, and other solid-state development.

SENIOR ELECTRONIC ENGINEERS

—MSEE or BSEE with background or interest in data transmission, solid-state development, systems and circuit design, or communications packaging.

—MSEE or BSEE with background in miniaturization and transistorization of RF circuitry.

ELECTRONIC ENGINEERS —EE degree, for solid-state digital circuits and systems design. Background in data processing and wireline transmission desirable.

The Electro-Physics Laboratories are located in the suburban Washington, D.C. area, where post-graduate study is available in several nearby universities. Housing is plentiful in attractive, well-established neighborhoods. Our relocation allowance is liberal.

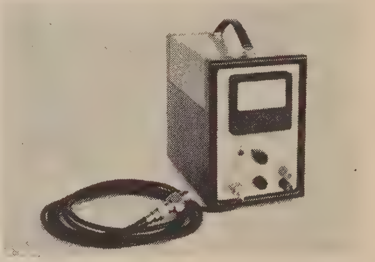
Hydraulic Peak Pressure Gage

A new hydraulic Peak Pressure Gage that indicates peak pressures with full scale ranges of 0–4000 and 0–10,000 psi has been developed by **Hydel, Inc.,** 223 Crescent St., Waltham 54, Mass. This gage is designed for use by service, field and production personnel to troubleshoot and correct hydraulic systems that are subjected to excessive transient pressures. It is compact, sturdy and simple to operate and can be used by personnel unfamiliar with electronic equipment.



The instrument contains in one package a pressure pickup, an amplifier and a peak detector, followed by a large meter. The meter will indicate the true absolute peak of pressure transients as short as one millisecond in duration. In operation, the meter deflects rapidly to indicate the value of a pressure peak and then decays slowly to the steady state pressure of the system. As the meter is decaying any transient of a pressure level higher than the instantaneous meter reading will again cause the meter to deflect to the new peak.

For those instances where a visual presentation or a permanent record of the pressure wave is desired, the gage has an output terminal (AUX. OUT) on the front panel into which a standard oscilloscope or oscillograph can be attached. When used in this manner the Peak Pressure Gage becomes a pressure amplifier with a full scale (0–4000 or 0–10,000 psi) output of 40 volts and a frequency response of 0–1000 cps.

Ionics Purchases Electron Arc

Purchase of all assets of **Electron Arc, Inc.,** Lynn, Mass., was announced by Edwin R. Gilliland, president of **Ionics, Inc.** Manufacture and sale of a broad line of specialized electrical power supplies and equipment including transformers, rectifiers and control panels will continue under the new name Electron Arc Division, Ionics, Inc.

Also marketed are high intensity "point" light sources used for visual aids in guiding aircraft to safe landings and for a variety of other industrial and commercial applications.

Special electronic controls developed by Electron Arc permit transmission of voice communications between line-of-sight points using a pencil-thin beam of light which eliminates breaking radio security and reliance on slower visual code signals in military operations. Civilian applications may include communications where maximum privacy and security are needed and wires are not available, or in hazardous locations where radio waves could cause explosions or interference.

Present production facilities of the new division in Lynn will be utilized until Ionics' new plant on Rt. 128 in Waltham, Mass. is completed next year. The company recently announced acquisition of land for the plant, with site development to begin this spring.

Ohlsen Appointed by Rutherford

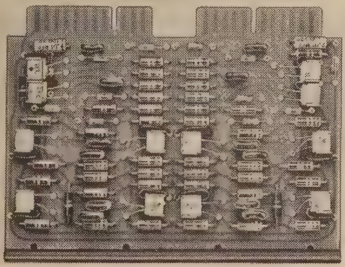
Rutherford Electronics Co., Culver City, Calif., announces the appointment of Richard J. Polsen as its production manager.

Ohlsen's responsibilities include; production, scheduling, manufacturing and quality control. Prior to joining Rutherford, Ohlsen was production manager of Networks Electronics Corp., Van Nuys, Calif. Previously he served 3 years with Coleman Engineering and 8 years with Universal Engineering Company as production manager.

A native son of Los Angeles, Richard J. Ohlsen resides at 2635 Corinth Ave., West Los Angeles, with his wife and son.

Synchronizer For Random Input

Computer Control Co., 983 Concord St., Framingham, Mass., has a new Model SY-101 Synchronizer, the latest addition to its line of digital computer modules, Series M, 3C-PACs.



The SY-101 is a double M-PAC designed either to synchronize random inputs to a clock, or to receive random parallel inputs and to deliver these serially to a counter. Each SY-101 package contains two identical synchronizer circuits. Up to six SY-101 packages may be grouped to allow accumulation of signals from 12 asynchronous sources for delivery to a single counter. Maximum synchronizing rate for an individual circuit is 30 kc, for a group of "n" circuits 30 kc/n.

Auxiliary circuits available for use with the SY-101 are the OM-102 clock source, and the BD-101 decade counter and several other M-PACs. Power requirements

An Invitation

for

PHYSICISTS

and

ENGINEERS

TO WORK ON

RESEARCH & DEVELOPMENT

AT THE

M. I. T.

INSTRUMENTATION LABORATORY

The Laboratory, with its staff of 1,000 employees, is primarily engaged in the conception and perfection of completely automatic control systems necessary for the flight and guidance of missiles and space vehicles. Many "firsts" in these fields have been developed at the Laboratory.

R and D opportunities exist in

- ANALYSIS OF SYSTEMS AND COMPONENTS
- ASTRONAUTICS
- HIGH PERFORMANCE SERVOMECHANISMS
- POWER SUPPLIES & MAGNETIC AMPLIFIERS
- DIGITAL & ANALOG COMPUTERS
- ELECTRO-MECHANICAL COMPONENTS
- TRANSISTOR CIRCUITRY & PULSE CIRCUITRY
- RESEARCH, DESIGN & EVALUATION OF GYROSCOPIC INSTRUMENTS
- COMPUTER PROGRAMMING & SIMULATOR STUDIES
- LOGICAL DESIGN
- AND IN MANY OTHER AREAS

Call or write:

DR. C. S. DRAPER,
Director

INSTRUMENTATION LABORATORY
MASSACHUSETTS INSTITUTE OF TECHNOLOGY
68 Albany Street, Bldg. 6A
Cambridge 39, Massachusetts
UNiversity 4-6900, Ext. 3544

• Graduate courses may be taken for credit while earning full pay • U. S. Citizenship required

Opportunities to *Grow* with Kollsman

AIR DATA INSTRUMENTS & SYSTEMS

Senior Project Engineers, EE & ME. For aircraft and missile instrumentation. 5 to 10 years' project experience in precision electromechanical devices, pressure transducers.

AUTOMATIC ASTRO TRACKING SYSTEMS

Project Engineers, EE. For automatic astro tracking systems. Up to 5 years' related experience.

STAFF ENGINEERS & SPECIALISTS

a) Experience in the research and development of transistors in servo, digital and instrumentation application. Minimum 3 years' experience desired in transistor circuit design for military applications.

b) Experienced with IR to UV radiation properties and applications, noise theory and detectors.

c) Optics—IR through visual optical design, lens design, materials.

d) Digital computers—logic or packaging experience.

e) Theoretical mechanics—inertial and trajectory studies.

f) Environmental Test Engineers, EE's and ME's with 2 to 5 years' experience in all phases of environmental testing on precision electromechanical instruments and systems.

Kollsman's leadership and continuing growth in the field of automatic navigation and flight instrumentation **for aircraft, missiles and other space vehicles** *assures excellent opportunities for qualified men. Please send résumé to T. A. DeLuca.*

New Electronics Firm

A new company has recently been formed and chartered to manufacture computer components of high reliability for the electronic control of machinery and processes. **Embree Electronics Corp.,** headed by John M. Embree, a management staff engineer, has entered the expanded field of automation. Shortly, the firm expects to market a line of related products in the field of electronic analog computers. Embree Electronics is engaged in the research, design, and manufacture of its computers which are used to solve mathematical equations to predict the behavior of dynamic systems and to furnish data for successful operation of automatic reactor controls, submarine maneuvering controls, missile guidance systems and controls for industrial and chemical processes. Marketing and applications engineering will be done on a nationwide basis through the West Hartford, Conn. office and through electronics manufacturers representatives.

Waveguide Data Chart

A new "Standard Waveguide Data Chart," has been prepared by the **Narda Microwave Corp.,** 118-160 Herricks Rd., Mineola, L. I., N. Y. Featuring military as well as EIA designation numbers, the chart shows virtually all required electrical as well as mechanical parameters for all waveguides in use today.

Up to now, engineers have frequently had to devote considerable amounts of time to calculating certain characteristics, attenuation factors, power ratings, etc. The new chart provides the most commonly-used data, eliminating the necessity for calculations. Some of the parameters covered are: cut-off frequency, theoretical attenuation for both brass and aluminum waveguides, theoretical C W power rating and the waveguide wavelength from the lowest to the highest frequency in any given band.

Mechanical dimensions are also given for all waveguides, along with their tolerances. This is especially valuable, since these figures can be used as a guide to minimum tolerances throughout the rest of a system under design. Engineers who do not work with microwaves on a regular basis will also be able to use this chart to find radius dimensions, type of flange available—either cover or choke—in both aluminum and brass; as well as dimensional information to help them determine

Soft
Landing
On
The
Moon...

A CHALLENGE TO EXCITE ANY ELECTRONICS ENGINEER WORTH HIS SALT... THE KIND RYAN NEEDS RIGHT NOW

Who will engineer a missile navigation system to make a "soft landing" on the moon? This is the kind of problem in avionics we're tackling here at Ryan – the kind that gets future-thinking electronics engineers excited.

Already Ryan is the world leader in continuous wave doppler navigation systems. This is one of several important reasons why Ryan is now the largest electronics firm in San Diego – *and the fastest growing!* If you are an electronics engineer ambitious to help advance the art, as well as your own career, through vital "frontier work" – we want you *right now* here at Ryan Electronics.

Ryan Electronics employs over 2000 people and has over one-third of the company's $149-million backlog of business. Under the leadership of some of America's most prominent scientists and engineers, Ryan is probing beyond the known . . . seeking solutions to vital problems of space navigation.

Expanding facilities of Ryan Electronics at San Diego and Torrance in Southern California are among the most modern in the West. You enjoy living that's envied everywhere, plus facilities for advanced study. Send your resume or write for brochure today: Ryan Electronics, Dept. 4, 5650 Kearny Mesa Road, San Diego 11, Calif.

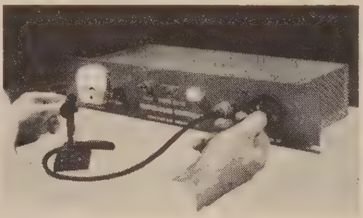
frequency ranges consistent with the mechanical and dimensional requirements of the equipment with which they are working.

Finally, the Narda designation number for each waveguide is also indicated, along with the EIA and military numbers, to facilitate ordering.

Copies of Narda's Standard Waveguide Data Chart may be obtained free from any of the company's representatives, or by writing directly to the firm.

Miniature Black Body Source

A new miniature infrared source for calibrating the seeking head of infrared guided missiles and other infrared sensitive elements in the 200°C to 600°C temperature range, has been introduced by the **Perkin-Elmer Corp.,** Norwalk, Conn. The new black body source, called the Model PE 521-6 Miniature Infrared Source, provides an accurately adjustable source of infrared radiation when used with the Model PE 521-6 Temperature Controller.



The infrared source and temperature controller can be used as a secondary standard of radiant energy by comparison with a primary source, or by auxiliary temperature measurement of the conical radiating cavity. The two units form a closed loop servo system which senses the temperature of the radiating core by means of a platinum resistance thermometer. The servo system also maintains the selected temperature by proportional electronic control.

The radiating element of the unit is a pure heated silver core with a conically shaped cavity. The high thermal conductivity of silver assures uniform temperature along the cavity walls. The surface of the cone is coated with a refractory material to increase its emissivity to near unity. A hole in the rear of the heated silver core allows access for convenient monitoring of the thermocouple.

The miniature infrared source and the temperature controller, constructed as separate units, are attached by means of a two-foot cable. A twenty-five foot extension cord is provided for remote operation. The source measures three inches long by three and one-half inches high. The temperature controller is housed in an 11-inch ×8-inch ×90-inch drawn aluminum cabinet.

Dryden V.P. of Pearce-Simpson

Pearce-Simpson, Inc., 3950 N.W., 28th St., Miami, Fla., Miami electronics manufacturer, announces the appointment of Robert E. Dryden as Vice President, Engineering. Dryden, a veteran in the electronics field, will head the new Research and Development Division of Pearce-Simpson.

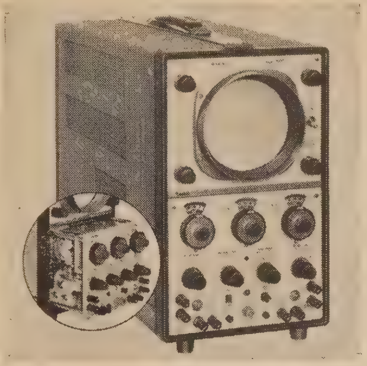
Dryden, a graduate of the University of Florida with a B.E.E. degree, formerly was director of the instrumentation division of Radiation, Inc., Orlando. Under Dryden's direction, Pearce-Simpson will establish a complete Research and Development division devoted to the field of military and commercial electronic test equipment. The new division will compliment the recently announced line of test equipment which Pearce-Simpson will manufacture under license agreement with Republic Aviation Corporation. The division will headquarter in the plant of the Pearce-Simpson Molded Plastics Div.

New Plant for Lieco

Lieco, Inc., Industrial Park, Syosset, L. I., N. Y., recently consolidated its operations in its new 20,000 sq. ft. plant at Syosset and announced the completion of arrangements with E.M.T. Corp., Newton, N. J. to market their new Balanced-Phase Flexible Waveguide. In making this announcement, Abe Zeitz, president of the company also stated that this makes it possible to supply his firms' customers with a complete line of waveguide assemblies in all frequency bands. These flexible waveguide lines supplement the variety of standard and custom rigid waveguide assemblies the firm is now producing.

Null-Readout Oscilloscope

A null balance technique, said to be used for the first time in an oscilloscope, introduces new standards of accuracy and speed for measuring analog data directly from the screen of the new Type 1100/700 Oscilloscope, a product of **Analab Instrument Corp.,** 30 Canfield Rd., Cedar Grove, N. J. To avoid the usual reading errors from the cathode-ray tube screen, the Analab Null-Readout System incorporates an anti-parallax scale, equivalent to a mirror-backed scale on a meter. With the Type 700 Dual-Channel Plug-In, incorporating 1% Null-Readout potentiometers for measuring amplitude on the two signal channels as well as sweep time, the Null Readout System is the fastest method for making direct, repeatable, accurate measurements without interpolation.



The Type 1100/700 Oscilloscope is of special modular design. The Type 1100 Main Frame is a basic, self-operable cathode-ray tube indicator which serves as the fundamental building block for the complete system of oscilloscopes. The Type 700 is a Dual-Channel Plug-In that is first of a series of plug-ins planned to operate with the Type 1100 Main Frame. This is the most flexible modular design yet conceived. There are 64 contacts available for the transfer of signals and voltages between the Type 1100 Main Frame and the plug-in.

In the Type 1100, operating without the plug-in preamplifiers, the X and Y post amplifiers have a bandwidth of dc to 500 kc with a sensitivity of 40 mv/cm (10 cm of full-scale undistorted deflection). When used with the Type 700, the over-all sensitivity of both signal channels is 100 μv/cm with a bandwidth of dc to 150 kc. The calibrated amplifiers can be used with single-ended or balanced input and provide deflection ranges from 1 mv full scale to 200 volts full scale (500 volts full scale uncalibrated) with a 17-step range switch in a 1, 2, 5 sequence for each amplifier. The 150 kc bandwidth is maintained on all ranges. The signal on either channel may be plotted against sweep time or against the other channel for X-Y plots.

The calibrated sweep offers speeds from 0.2 μsec/cm to 50 seconds full scale in 22 range steps, with 5:1 calibrated sweep expansion available on all ranges. Uncalibrated sweep times extend to 2 minutes.

The variable length sweep constitutes another innovation in oscilloscopes. It proves a gate signal with a variable length that is calibrated from 1 μsec to 50 seconds. Uncalibrated, the gate length can be increased to 2 minutes. The fall time of the variable-length gate can be used as a delaying trigger to delay the sweep of another oscilloscope or a second sweep in another plug-in soon to be made available. The variable-length gate can also be used to start and stop an external electronic counter for digital readout of sweep time, or to assist the counter in picking out portions of extremely difficult-to-synchronize complex waveforms.

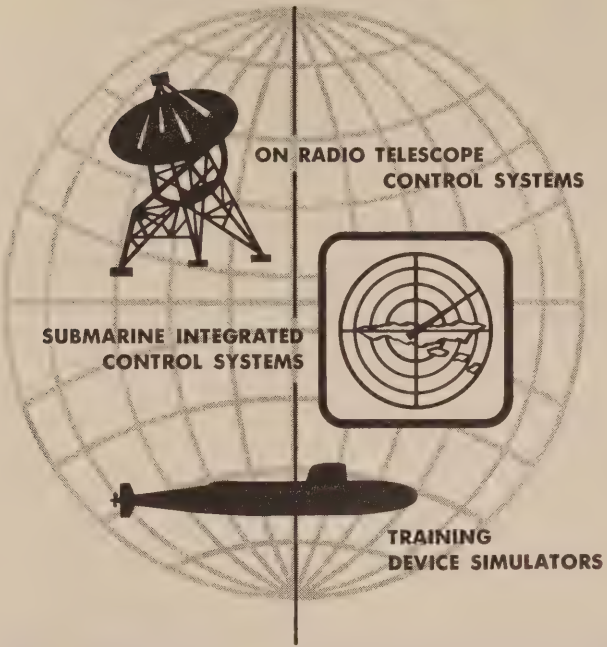
DIVERSIFIED
ASSIGNMENTS



IN SYSTEMS APPLICATION
SECTION

Pioneer in design and development of nuclear powered, missile firing submarines, Electric Boat Division of General Dynamics is expanding its successful and diversified research and development activities in advanced technological areas: large control systems (world's largest wind tunnel, precise radio telescope); training equipment (simulators and trainers for missiles, submarines and other weapons systems); submarine integrated control systems (to include ship and weapons control, display, sensor, communications and data processing systems).

OPPORTUNITIES ARE NOW OPEN FOR GRADUATE ENGINEERS:

SYSTEMS ENGINEERS
To perform conceptual engineering and systems analysis on complex electromechanical and hydraulic systems, coordinate the technical efforts of detail engineering, and perform customer technical liaison.

ELECTRICAL ENGINEERS
To perform system analysis for determination of servo requirements, particularly for large horsepower applications; and to design special purpose electronic circuits for use in control, computation, measurement and communications area.

SYSTEMS EVALUATION ENGINEERS
To perform conceptual engineering and production engineering of electronic equipment, with particular regard to circuit development.

If you are qualified in any of these areas, and would like to live and work on the Connecticut shore just half way between New York and Boston, send a resume with salary requirements to James P. O'Brien, Technical Employment Supervisor. All inquiries in confidence.

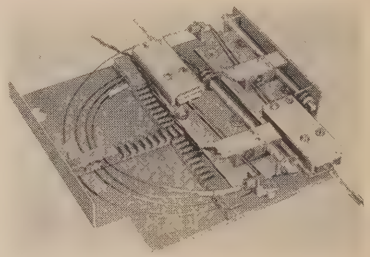
Ultrasconic Delay Line

The Ultrasonic Delay Line, U.D. Series developed by **Curtiss-Wright Corp.,** 35 Market St., East Paterson, N. J., launches and propagates accoustic waves along a wire transmission media of low temperature coefficient of delay to achieve delay stability over a wide range of temperature (5 parts per million per degree centigrade over a range of −55°C to 100°C). The relatively low speed of wave travel which is characterized by the torsional mode has a wide range of delay, 5 to 12,000 microseconds. The unit is incased in a small, rugged and compact enclosure.

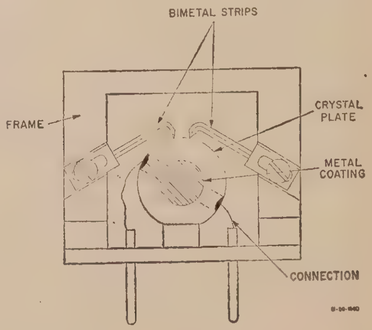


The simple and rugged construction of the coiled wire delay media permits the unit to withstand a wide range of environmental military vibration and shock. The U. S. Series has a center frequency ranging from 100 kc to 1.2 mc with a maximum bandwidth of 1 mc. The unit can be used with a carrier frequency or without for pulsed operation. It also has a wide range of input and output impedances to allow for optimum impedance matching.

The U.D. Series is available in both standard and custom designs to most applications for computer bit storage, coders and decoders, telemetering and navigational systems, radar simulators, missiles and aircraft.

Crystal Stabilizer

More precise control of radio frequencies can be achieved with a newly developed and fairly simple stabilization device for quartz crystals, the **Department of the Army** announced.



The new device promises real savings in size, weight and power requirements over the special electronic ovens or heaters which are now widely used in maintaining constant crystal temperature.

The device was developed at the **U. S. Army Signal Research and Development Laboratory,** Fort Monmouth, N. J., by Dr. Eduard A. Gerber of West Long Branch, N. J., one of this country's foremost authorities on frequency control.

The new device uses temperature-sensitive bimetal strips, or fingers, pressing against certain spots on the edge of the crystal. Each of the strips is made of two metals with different rates of expansion and contraction. Acting much like thermostats used in heating systems, these metal fingers apply the right amount of pressure to keep the crystal operating on frequency as temperature fluctuates. The fingers may number one, two, or more, depending on the application.

In spite of the high degree of stability in crystals, temperature variations do tend to cause a change in the crystal vibration frequency—or "frequency drift." While crystal ovens have proved satisfactory for reducing drift in many applications, the typical oven may occupy two cubic inches or more of critical space and also consumes a considerable amount of power in maintaining constant crystal temperature.

By contrast, the new device can be made one-tenth the size of the crystal oven, being entirely mechanical in operation, and cuts power requirements. In battery powered equipment, including satellite systems, space and weight reductions are significant, especially considering the possibility of reducing battery size and weight due to decreased power requirements.

Another benefit which may be gained from use of the bimetal strips is extended useful life of crystals. The heat of the ovens causes accelerated aging of crystals.

Radial Connector

Elco Corp., M St. Below Erie, Philadelphia 24, Pa., announces a new Radial Connector, designed in co-operation with one of Elco's customers. The connector has 15 contacts at approximately 5° spacing; guide pins and bushings; set-screw looking device which permanently secures connector in mated position. Connector employs Varicon mating principle; contacts are from Elco Series 5000. The forklike Varicon contacts, with 4 mating coined surfaces,

A
3-PHASE
PLAN TO

STEP OUT OF SPECIALIZATION INTO TRUE SYSTEMS ENGINEERING

Engineers with significant experience in *any* of the following areas can qualify for this unusual approach:

Test Equipment
Consoles
Digital Data Transmission & Recording
Power Generation & Transmission
Digital & Analog Computing
C-W Radars
Feedback Control
Airborne Transponders
Microwave Communications
Acquisition & Tracking

Unique systems programs underway at the Defense Systems Department embody the engineering disciplines listed above. If you can contribute in *any* of these areas, you'll have an opportunity to learn as many of the *others* as your abilities permit. Here's how it works:

STEP 1 Join a system project at DSD as an expert in any of the fields listed above.

STEP 2 Learn one, two, three or more of the other disciplines applying to this system and broaden your overall systems knowledge.

STEP 3 Move up to higher levels of responsibility in true systems engineering as fast as your growing capabilities permit.

STEP 4 Based on your interests and aptitudes, you have the opportunity to build further from systems engineering into program management.

TAKE THIS STEP NOW! Get the full facts on how you can take advantage of this plan to gain abilities and responsibilities in large scale systems engineering. Drop a note outlining your education, experience and interests, in professional confidence, to:
Mr. E. A. Smith, Box 6-F

GENERAL ELECTRIC

Northern Lights Office Building, Syracuse, New York

DESIGN ENGINEERS

check these openings in advanced gyro and electrical components design

In 1949, Honeywell developed and flight tested the floated gyro for control systems. Since then, its Gyro Design Group has become the focal point for a multi-million dollar component development program, supporting the inertial navigation industry. This is, perhaps, the most advanced program of its kind. It has expanded rapidly and now has openings for additional top level engineers.

This group is involved in all fields of gyro design. It works in such areas as *precision gyro and accelerometer design, hydro-dynamic bearings, vibratory mechanisms, precision electric suspension techniques and gyro magnetics.*

The men needed to fill these positions should be capable of developing advanced concepts for gyros and of following through on their projects. They should have a minimum of two years' (and up to twenty years') experience in such areas as *precision gyro mechanics, servo techniques, digital data handling, electronics packaging, advanced instrumentation,* or *magnetic component design.*

To discuss these or other openings, write Mr. James A. Burg, Dept. 662D, Aeronautical Division, 1433 Stinson Blvd., Minneapolis 13, Minn.

Honeywell

H *Military Products Group*

To explore professional opportunities in other Honeywell operations coast to coast, send your application in confidence to H. K. Eckstrom, Minneapolis 8, Minnesota.

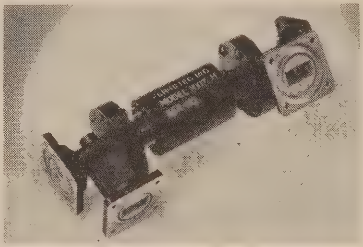
assure low contact resistance, high current rating, complete reliability after thousands and thousands of insertions and withdrawals. Varicon mating principle described in Elco Catalog V3; Technical Bulletin 108A gives all data and specifications relating to Series 5000 board-to-board printed circuit Varicons.

Ku-Band Switch

Highlight of **Ferrotec Inc.'s**, Newton Mass., IRE Show booth display was the introduction of a new Ku-band high power fast switch enabling two microwave antennae to be time-shared by a common transmitter and receiver, maintaining high isolation between the magnetron and load.



The Model R-107H is said to be the first fast-switch capable of handling peak power levels of 100 kw, at 100 watts average, and can be switched at speeds under 10 microseconds. Switching is performed using less than 70 watts peak and 2 watts average power.

The switch operates over a 2% band between 15.7 and 16.9 mc., with loss of 0.5 db, maximum VSWR of 1.20, and isolation between ports greater than 20 db. The switch is operable over the fulll temperature range between −40°C and +100°C.

Ferrotec's high power fast-switch employs the Faraday rotation principle, using a ferrite structure between a pair of compact two-mode transducers. The output transducer is oriented 45° with respect to the input transducer.

Among additional applications of the Model R-107H are service as a high frequency, high-power modulator, and as a variable attenuator.

EXCELLENT OPPORTUNITY

for qualified electrical and/or electronic engineers in expanding Research and Development Division.

Project Engineers have complete responsibility for the development of instruments and control systems related to the pulp and paper industry. Please send resumes to

The Champion Paper and Fibre Company

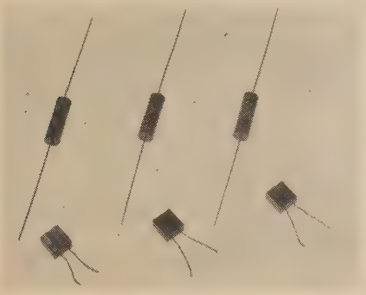
Hamilton, Ohio, to the attention of Kenneth L. Faist, Assistant Personnel Director, General Personnel Administration.

and manufacturers of telemetry and instrumentation products, announced this week the production of a new line of dc/dc power supplies. This new line, primarily for missile and other airborne applications, is designed to step up dc power and for precision regulation against line and load variation, even under large, ambient temperature changes and other severe environmental conditions. Meets MIL-E-5272C. These solid-state units provide maximum reliability, minimal size, and a range of voltages from 5 vdc to 250 vdc in 34 standard models.

For further information, write to Tom Watson at the firm.

Chokes Solve RF Noise Problems

The Magnetic Products Div. of **Stanwyck Winding Co., Inc.,** P.O. Box 70, Newburgh, N. Y., announces two types of encapsulated chokes containing Ferroxcube ferrite shielding beads and having large values of RF reactance and resistance in HF and VHF regions for broadband isolation and decoupling. The tubular type utilizes coaxial leads; the transistor module type has both leads projecting from one side. Both have an inherently high impedance and low Q characteristics which make them ideally suited for radar and microwave IF strips, parasitic suppression in parallel tube amplifiers, tube life test racks, radio interference suppression from spark plugs, relay contacts, etc. They are color coded for ease of identification, meet MIL standards and are available in bulk for manual insertion or in tape-type reels for automatic machine insertion in printed circuit cards. Write for technical bulletin—or, if you wish, order an engineering kit containing 20 chokes in various values for $10.



Welch Sales Mgr. of Relay Sales

Richard O. Welch has been appointed sales manager of **Relay Sales,** West Chicago, Ill., announced E. E. Rullman, president of the national relay distributor. Welch, formerly with Automatic Electric Co., has over 23 years background of engineering, manufacturing, field application and sales of all types of relays. For the past 12 years Welch worked exclusively on application engineering of relays, switches, and custom assembly in all electronic markets and in the telephone industry.

FACTS and FIGURES about SANDERS That Add Up to TOP ENGINEERING OPPORTUNITIES

1 Dramatic growth in 8 years from an 11 to 1300-man organization.

2 Diversity—20 R&D contracts at time of writing.

3 Stability—substantial production activities as well as advanced R&D.

4 Backlog at beginning of '60—$20,000,000.

5 Gross sales of $10,600,000 in 1959—an increase of 18% over 1958.

6 A sales goal of $15,000,000 in 1960 (with very reasonable expectations of meeting it).

7 A record of original engineering achievements such as PANAR® radar; FLEXPRINT® flexible printed circuits; TRI-PLATE® microwave products.

8 Location: Nashua, a progressive city of 50,000, is in the beautiful New Hampshire hill country less than an hour from downtown Boston. No state income or sales taxes.

Continued Expansion Creates Openings for Imaginative Engineers in the Following Areas:

SYSTEMS ENGINEERS

Through Project Engineer level. Need not be specialists, but must have creative abilities and backgrounds of VHF transmitters and receivers, communications systems in general, data processing techniques, propagation and must be capable of translating this knowledge into complex integrated systems.

RECEIVER DESIGN ENGINEERS

VHF electronically scanned airborne receivers, filters, problems in spurious response reduction and multiplexing.

CIRCUIT DESIGN ENGINEERS

With particular emphasis on transistor application to analog and digital techniques; data handling equipment; audio; video; RF circuitry and switching.

TRANSMITTER & MAGNETIC DESIGN ENGINEERS

To learn more about opportunity for YOU at Sanders, send a resume to Lloyd Ware, Staff Engineer, Dept. 908.

MICROWAVE
TUBE R&D

The Electron Tube Division of Litton Industries has an international reputation for its capability in translating advanced concepts into microwave devices of high reliability. In part this is due to management by experienced engineers and, as a design engineer here, you will have well qualified support people on your team.

You will be working for a large company but...

You will be working in a small group on the product of your choice—TWT's, Superpowered Klystrons, crossed field amplifiers, or other sophisticated microwave devices.

Choose research or design and development, whichever field interests you most.

The location is in the San Francisco Bay Area. Your children will belong to one of the nation's great elementary school systems. You, yourself, will be close to all the cultural activities of San Francisco, the Berkeley campus of the University of California, Stanford University, San Jose State College, and the University of Santa Clara.

Openings exist for Senior, Project and Junior Engineers. Junior Engineers need have no experience beyond their baccalaureate in E.E. or Physics.

We assist with relocation expenses. Interviews may be arranged by writing, or telephoning collect to:

Mr. Thomas A. Fike
960 Industrial Road
San Carlos, California

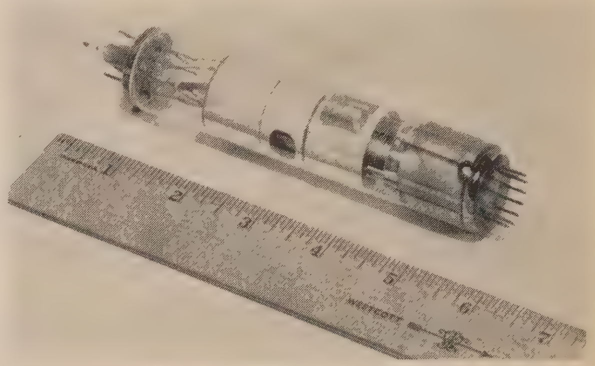
High Frequency Radar Amplifier

An improvement in receiver sensitivity of a coherent Moving Target Indicator radar system, equivalent to a 50% increase in range or a five-fold boost in transmitted power, is claimed by a new high frequency amplifier tube used in combination with a "synchronous pumping" mode of operation.

Other fields of application include long range radar for air traffic control and surveillance, early warning of hostile aircraft or missiles, and satellite surveillance.

The new equipment was developed by **Zenith Radio Corp.,** 6001 Dickens Ave., Chicago 39, Ill. and tested at the Rome Air Development Center, Griffiss Air Force Base, New York. Application of the synchronous pumping technique was originally suggested by Kenneth G. Eakin of RADC.



L-BAND QUADRUPOLE AMPLIFIER TUBE

The electron beam parametric amplifier was recently developed by a team of research scientists headed by Dr. Robert Adler, associate director of research at Zenith, in association with Dr. Glen Wade, Stanford Electronics Laboratory. The device is regarded as a "promising newcomer to the vacuum tube family," and provides high signal amplification over a broad frequency band with extreme stability and very low noise, the announcement states.

Tests of the equipment at RADC, the announcement states confirmed expectations that the synchronous pumping technique permits full utilization of the amplifier's low-noise potentialities in high-performance, moving target indicator radar. Prior to the tests, the announcement explained, a general, but erroneous, belief existed among scientists that some measure of impairment of the performance of parametric amplifiers, caused by noise picked up by the idler channel and "dumped" into the signal channel of the tube, could be avoided.

During the tests, minimum detectable signal measurements were performed on the radar, with observations taken on the dipolar and unipolar video output of the MTI synchronous detector, and also the video output of the normal linear detector. With synchronous pumping, the average improvement in sensitivity observed was 10 db on the synchronous-detector channel, and 9 db on the linear-detector channel.

The announcement stated that these figures exceed the expected 7 db improvement, probably because the effective antena temperature was less than 290°K.

Comparison photographs of the A-scope display of output of the synchronous and linear detectors, with "non-synchronous" and also with synchronous pumping, were made. In each case, the IF gain was adjusted to equalize the noise levels. In the condition labelled "non-synchronous pumping," an independent signal generator replaced the synchronous-pump generator.

The improvement with synchronous pumping over non-synchronous pumping is clearly evident in the photographs, the announcement said.

AIR TRAFFIC CONTROL SYSTEM DEVELOPMENT

. . . A growing area of activity at The MITRE Corporation where original thinking can find broad application

The MITRE Corporation is directing its experience in System Engineering toward the development of an integrated air defense/air traffic control system. To test the techniques and designs for full-scale system implementation, an advanced active experimental program, SATIN (SAGE Air Traffic Integration), is being developed by MITRE under contract from the Federal Aviation Agency. Employing a SAGE AN/FSQ-7 computer and associated radar and communications networks maintained by MITRE, SATIN will be capable of controlling aircraft in a test area that includes New England, New York and New Jersey.

MITRE's Air Traffic Control Department faces exacting problems in the areas of system design, development and evaluation. Precise methods must be developed for providing improved en route air traffic control services without compromising the air defense mission.

Engineers and scientists with an interest or previous experience in air traffic control problems are invited to investigate immediate Technical Staff openings.

Inquiries may be directed in confidence to:
VICE PRESIDENT — TECHNICAL OPERATIONS

THE
MITRE
CORPORATION

POST OFFICE BOX 31 — 4-MH
LEXINGTON, MASSACHUSETTS

MITRE is an independent system engineering organization, formed under the sponsorship of the Massachusetts Institute of Technology. Its convenient location in suburban Boston affords excellent opportunities for advanced study under MITRE's liberal educational assistance program.

HIGH

NE-51H
8 TIMES BRIGHTER

DIALCO® **PILOT LIGHTS**

with Built-in Resistor
(a patented DIALCO feature)
for the **Neon Glow Lamp NE-51H** (High Brightness)

RUGGED: The NE-51H Neon Glow Lamp is made to resist vibration and is proof against sudden failure. It may be operated at about 3 times the level of current applied to the standard neon lamp, and it will produce 8 times as much light—*with long life!* Requires low power—less than 1 watt on 250 V circuit. Recommended for AC service (may be used on DC circuits above 160 V).

BUILT-IN current-limiting resistor (U.S. Patent No. 2,421,321): For use on 105-125 volt and 210-250 volt circuits. In DIALCO Pilot Lights, the built-in resistor is completely insulated in moulded phenolic and sealed in metal.

COMPACT: Units are available for mounting in 9/16″ and 11/16″ clearance holes...in a wide choice of lens styles and colors, terminal types, metal finishes, etc. Meet applicable MIL Spec and UL and CSA requirements.

Every assembly is available complete with lamp.

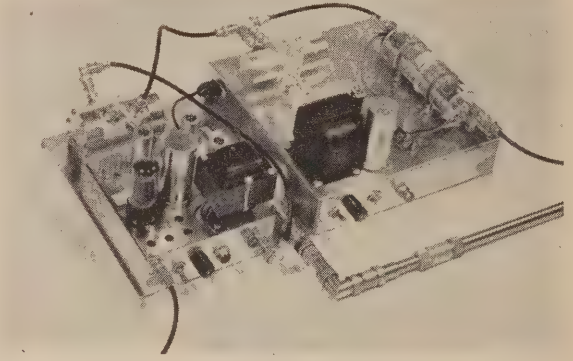
(Continued from page 174A)

The quadrupole amplifier tube employed in the tests was inserted directly between duplexer and mixer of the existing radar. Since the Adler tube is unidirectional, no circulator or isolator is needed. Its input and output impedances are resistive and independent of gain. The existing impedance match is not disturbed, therefore, nor is the stability of the receiving system impaired.

The frequency response of the amplifier used is flat over a band of about 80 mc centered at 1300 mc. It is normally operated at about 20 db gain, although the gain may be adjusted from −1 db to over +30 db by varying the pump power. (With the pump off, the tube acts as an isolator, with about 1 db insertion loss.)



SYNCHRONOUS PUMP GENERATOR

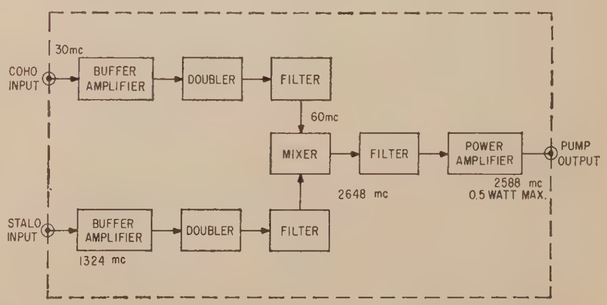
The shape of the bandpass characteristic is completely independent of gain. Gain stability is high, with only about a 1.3 db change in gain (at 20 db gain) occurring for a 10% change in pump power.

The broadband noise figure of the amplifier tube itself, the announcement said, is 1.3 db. Prior to insertion of the amplifier, the radar system noise figure was 8.5 db. With the amplifier in place, the resulting system noise figure was 1.6 db. This is the single channel noise figure, the announcement stated, since no allowance for "idler-channel" effects has to be made when the synchronous pumping technique is employed in the system.

The particular tube used in the tests at RADC was developed by R. L. Cohoon, research engineer in Dr. Adler's group at Zenith.

In a coherent MTI radar system using the new amplifier and the synchronous pumping technique, the announcement stated, it is possible to derive a synchronous signal for pumping the parametric amplifier and use it in such a way that the signal and idler are made to coincide exactly.

Under these conditions, signal and idler add coherently in the detector and cooperate in producing the output. Since the coherence applies to noise inputs and to the desired echoes alike, no reduction in signal-to-noise ratio results from the presence of the idler channel.



(Continued on page 178A)

CORNING STANDARD INDUCTORS		**DELIVERED OFF THE SHELF** 27 values ranging from 0.05 uh to 2.0 uh. High Q, 120 to 250. Frequency range from 10 MC to over 250 MC. High reliability under shock and vibration, since conductor is fired into glass, cannot shift. Low TC: 0 to +20 ppm/°C. Operation range from −55°C. to +125°C. No drift even under drastic dT. For panel or printed board mounting. Standard tolerance is ±10%. ±5% also available above 0.25 uh. **NEW KIT** for prototype work contains 10 different inductors with four tuning cores and other accessories, along with 50-page brochure of performance charts. Contact distributor serviced by Erie Distributor Division. CORNING TRIMMER CAPACITORS		**ROTARY** in three models for high-frequency tuned circuits. Standard: to 12.0 mmfd; Split bushing: to 12.0 mmfd; Precision: to 4.0 mmfd; Full rating from −55 to +125°C., TC: +50 ±50ppm°C. Nonporous silver plating for corrosion resistance available on request. **DIRECT TRAVERSE** for linear tuning. Full rating from −55°C. to +125°C. TC: +50 ±50 ppm/°C.; 0.5 to 3.0 mmfd; 1.0 to 7.5 mmfd; 1.0 to 8.0 mmfd; 1.0 to 12.0 mmfd. **MINIATURES** for ultrafine tuning. .40 uuf△/turn. Fixed cavity tuning. Silver-plated hardware for highest Q and corrosion resistance. Zero derating at 125°C. No backlash. Complete circumference thread contact with direct traverse motion. Panel mount or printed board. 1 to 4 mmfd; 1 to 8 mmfd; 1 to 12 mmfd; 1 to 18 mmfd.
CORNING ENCLOSURE TUBES		Both rectifier tubes and bushings. Made from selected glass for maximum mechanical and thermal strength. High temperature operation. High metallized bond strength: 1200 to 1500 psi. Impervious to moisture, fungi, dust, etc. Transparent, so you can inspect inserts visually. Also available with frosted glass. Made to your specifications.
DELAY-LINE COIL FORMS		For distributed constant delay lines on low loss forms. Scribe gap: 0.0040″ ±0.0010″ wide. O.D.: 0.200; 0.230; 0.240; 0.250. Up to 8″ lengths with up to 40 lines. Forms can be produced to your specs. Short delivery time.

WHY CORNING MAKES THE MOST STABLE METALLIZED COMPONENTS

When we started fusing silver onto glass, there were roughly 60,000 glass formulae to choose from. Result: glass and metal matched perfectly for compatibility and operational characteristics.

When we fire metal to glass, it stays put. Even through tremendous thermal and mechanical shocks.

When we deposit metal, we are sure of a uniform, thin film, completely free from breaks.

Glass is chemically inert, cannot react with metal to alter properties.

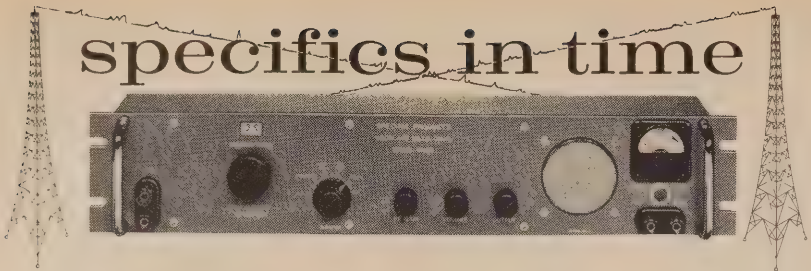
Glass is non-hygroscopic. It will not warp or change its shape. Its coefficient of expansion is much lower than that of most other materials used for metallizing.

Add to all this the fact that we practically invented metallizing. This early start has helped raise metallizing from an art to a science with which we can beat your tightest specifications in mass quantities at low prices.

For more information, send for data on any of the components shown above. Check the literature card in this magazine or write direct to 542 High Street, Bradford, Pa.

CORNING ELECTRONIC COMPONENTS

CORNING GLASS WORKS, BRADFORD, PA.



specifics in time

If you are being pressed for ever increasing accuracies in the dimension of time, **Specific Products** and the National Bureau of Standards can help.

NBS radio stations WWV and WWVH provide pulsed time signals accurate to at least one part in fifty million. By tuning one or more of the station frequencies you can make use of these exquisitely accurate time tics.

The new, all transistorized Model WVTR receiver by **Specific Products** enables you to do just that. This rack mount version of our previously announced Model WWVT (portable) brings to your calibration lab every bit of that one-in-fifty-million-parts accuracy. Furthermore, its convenience of operation makes a cinch of otherwise tedious calibration work.

Model WVTR rack mount

Five National Bureau of Standards frequencies — 2.5, 5, 10, 15, 20 and 25 mc — are instantly available at the touch of the dial. The conveniently packaged unit measures 3½" x 19". Power is either by 6 size D flashlight batteries or AC power pack. Both a speaker and an S meter are provided for frequency comparison and signal level. Price of Model WVTR is $725.

As a public service **Specific Products** presently publishes two bulletins on how you can use WWV and WWVH broadcast signals in your work. Bulletin #159A generally describes the free broadcast service. Bulletin #460 specifically describes the use of the broadcasts in calibration work.

RIXON

THE SEBIT SERIES
Transmits—receives data to 4800 baud (Bits/sec.) over voice band, wireline circuits. Transistorized & modular

TONEKEYERS & DEMODULATORS
For low cost (non-synchronous) operation at up to 1000 baud (Bits/sec.) • ON-OFF tone keying for data and signaling

VARIABLE-DELAY EQUALIZERS
Compensates for differential delay and distortion over wireline and other narrow band circuits. An essential for data transmission

SEMI-CONDUCTOR RELAYS
For signaling and switching up to 2500 baud (Bits/sec.) • Eliminates maintenance—direct replacement for WE 255A

The above equipments have become standard and are outstanding examples of RIXON'S understanding and capability in the area of data communications. Write for bulletins on the above equipment, then bring your requirements to RIXON.

USAF, USASC, NSA, USWB, PMR, NRL, NATO . . .

If you know these symbols, then you know your ABC's of who needs data communications. It's as simple as that . . . and the above organizations know that RIXON is rated TOPS in the field of data communications.

HERE'S WHY . . .

- RIXON'S sub-systems and components are pre-engineered and are flexible for adoption to your advanced communications requirements.
- Experience in varied design and development projects has provided RIXON with the *know-how* in solving the most challenging problems in the field of data communications.
- Simplified and unsurpassed uniqueness in low cost design. RIXON has the outstanding ability for advanced designs of transistor circuits and passive and tunable electronic filters.

(Continued from page 176A)

For this reason, the announcement continued, performance attained is fully characterized by the so-called broadband noise figure of the parametric amplifier, which can be extremely low.

The pumping signal is generated by doubling the stalo (1324 mc) and coho (30 mc) signals that are available from the existing radar, and mixing the two resulting frequencies. An amplifier and filter select the difference (2588 mc), which is precisely twice the transmitter frequency (1294 mc), and apply it through a phase shifter to the quadrupole pumping structure.

With a linear detector, the pump phase is of no importance, but an optimum phase exists when the MTI is employed.

The improvement in sensitivity observed applies not only to the MTI channel employing the synchronous detector, but also to the normal channel with a linear detector. This results from the presence of both signal and idler components of the target echo within the pass band of the IF amplifier. Under these conditions, precise coherence is no longer necessary to obtain performance corresponding to the broadband noise figure; synchronization of the pumping source merely insures that the the idler channel will be accepted by the subsequent system.

The consequences of these results are that synchronously-pumped parametric amplifiers may be directly applicable to a much broader range of practical systems.

X-Y Oscilloscope

Type 503, a differential-input X-Y oscilloscope with sensitivity of 1 mv/cm, in the dc-to-450 kc range has been designed by **Tektronix, Inc.**, P.O. Box 831, Portland 7, Oregon. It utilizes a minimum number of tubes (equivalent 17 plus rectifiers) for the maximum degree of reliability.

Vertical and horizontal amplifiers are identical. Characteristics include: input

Day by day the Polaris missile gets nearer to its first submarine test firing... nearer the day when, operational, it will become one of our nation's most formidable deterrents to aggression. For with submarines serving as mobile missile launching pads, any target on earth is within deadly striking range if retaliation becomes necessary.

The Polaris-launching submarines are splendidly fitted out not only to aim and fire and accurately guide the missile, but also to defend themselves. Advanced Sperry submarine equipment contributes to both these functions. For precise navigation there is SINS (Ship's Inertial Navigation System), automatic steering and stabilization, depth detectors, gyrocompasses, diving and maneuvering controls, instrumentation, and computers... and the NAVDAC computer which correlates all navigation data. For anti-submarine warfare the subs have Sperry torpedo fire control systems, sonar sub detection equipment, the attack periscope itself. At two special laboratories both aspects of the Polaris program are being refined and integrated: one of which simulates submarine navigation, the other the environments of the sea.

Sperry's role in the Polaris program is typical of the Company today, achieving through specialized divisions an integrated capability that is contributing to every major arena of our environment. General offices: Great Neck, N. Y.

50 YEARS 1910 1960

Armed Forces Standardize Microfilm

Engineering Data Micro-reproduction System Covers Films, Punch Cards, Aperture Cards

The Armed Forces, operating active files containing more than 50 million drawings, have set military requirements for microfilming engineering drawings and related data.

The standards and specifications released April 15, 1960, by the Department of Defense for its Engineering Data Micro-reproduction System establish uniform methods for microfilming and standard formats for data presentation.

These uniform methods and standard formats, the Defense Department said, offer great space, time, and money savings.

New possibilities for inter-service exchange of engineering data are opened through the use of microfilmed drawings and related data, the Department of Defense announced.

What does this mean to industry?

Military agencies using the specifications of the Engineering Data Micro-reproduction System will ask contractors to submit engineering data in 35mm roll microfilm and punch cards. From the microfilm and punch cards, such military agencies make aperture cards to distribute engineering data for the procurement, maintenance, and supply of the nation's weapons systems.

In addition, other military agencies may require contractors to submit completed aperture cards. In these cases, the master microfilm and distribution copies are furnished in mounted aperture cards.

Even now, a number of prime contractors and sub-contractors are using a portion of the newly-adopted specifications and standards. For them, the new requirements will be integrated into existing programs.

Many contractors, anticipating the standards and specifications, have held microfilm programs in abeyance. Their engineering departments now have a ready-made set of instructions for upcoming programs.

The new standards and specifications are expected to have a cumulative effect. As more companies have microfilm equipment, industry will intensify its use of microfilm for distributing data. Even before specifications were announced, prime and sub-contractors were exchanging engineering data in microfilm format.

Industry helped set standards

Compatibility with industry is the keystone in the new standards and specifications of the Department of Defense. Industry originates much of the engineering data used by the DOD. Industry, in helping to set requirements, has created instructions that can be used for its own operations.

Standards cover broad areas

The standards and specifications documents already released are:

MIL-M-9868, Microfilming of Engineering Documents, 35mm Requirements for;

MIL-P-9879, Photographing of Construction/Architectural Drawings, Maps and Related Documents, 105mm, requirements for;

MIL-C-9877, Cards, Aperture;

MIL-C-9878 Cards, Tabulating and Aperture for Engineering Data Micro-reproduction System;

MIL-STD 804, Formats and Coding of Tabulating and Aperture Cards for Engineering Data Microreproduction System;

MS-21319, Gage, Aperture Cards No. 201-1.

Interim Federal Specifications cover silver halide, diazo-type, and heat developing microfilm.

The complete Department of Defense standards and specifications cover:

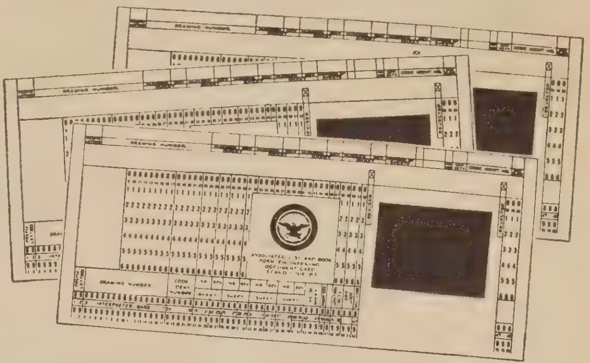
- The raw film stock used in microfilm;
- The methods and techniques of microfilming engineering data for the Armed Forces;
- The formats of the tabulating cards used to generate aperture cards;
- The formats of the aperture cards used as carriers for the microfilm data;
- The methods and techniques of mounting microfilm into aperture cards;
- The wide range of equipment to be used in the micro-reproduction system. This equipment includes microfilm cameras, testing equipment to inspect filmed engineering data, film mounters, film printers, and print-out units.

3M makes microfilm so easy to use

You can depend on 3M's continuing research, precision manufacturing, and standards-compatible products to make microfilm so easy to use.

FILMSORT Aperture Cards and Copy Cards, long used by Government and industry, are designed to meet the specifications and standards for the Engineering Data Micro-reproduction System. And now, to speed your use of FILMSORT Aperture Cards, 3M supplies both the printed card and the aperture. You save in shipping costs. You get your cards faster.

FILMSORT Microfilm Copiers, Mounters, and Readers are designed exclusively for Filmsort Aperture Cards. They are engineered to make your micro-reproduction system profitable.



THERMO-FAX "Filmac 200" Reader-Printers make microfilm practical for industry and Government. The advantages of a reader and a printer are combined in one compact, low cost unit. Huge viewing screen . . . simple push-button operation . . . you can obtain copy after copy in 18″ x 24″ size, or half size prints, of engineering drawings and records from microfilm in FILMSORT Aperture Cards. The "Filmac 100" Reader-Printer delivers 8½″ x 11″ copies in seconds.

For more information about the new Defense Department microfilm specifications and how they affect your business, mail the coupon right away.

PROVEN PROCESSES

At Buckbee Mears, photomechanical techniques have been refined and applied to products in the electronic field.

Results are:

- Shadow masks for Color T.V. tubes
- Electroformed mesh for storage display tubes
- Micro Mesh Sieves for particle sizing
- Etched reticles in glass or metal
- Etched metal parts to rigid specifications
- Etched circuits, rigid board or flexible

All of these and many more products are possible through the application of proven processes at Buckbee Mears.

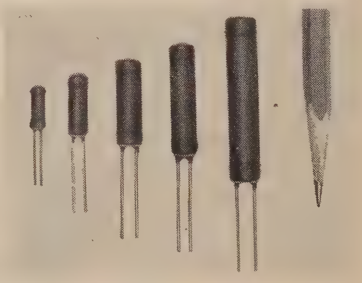
stages electronically regulated, calibrated steps to 20 v/cm, adjustable between 14 steps and to over 50 v/cm uncalibrated, differential input and constant input impedance (for easy probe use) at all sensitivities.

Other features include: functional panel layout, 8×10 cm viewing area, 21 calibrated sweep rates with 5 degrees of magnification, electronically-regulated power supplies, and extremely adaptable trigger facilities.

The price is $625. The rack-mounting model, RM503, is available now at $640.

Base Mounted Wire Wound Resistors

Type PRS wire wound, miniature, precision resistors produced by **Dale Products Inc.,** Columbus, Neb., are base mounted with two parallel leads. They need an area equal to their circumference for mounting purposes. These new resistors, designed to meet power requirements in printed circuits where space is at a premium, offer a solution to miniaturization design problems.



These new resistors are available in 4 wattages, 3, 5, 7 and 10, and in 5 sizes ranging from $\frac{9}{16}\times\frac{3}{16}$ to $1\frac{25}{32}\times\frac{3}{8}$. Tolerance range is 0.05, 0.1, 0.25, 0.5, 1 and 3%. Resistance range is from 0.05 ohm to 175K ohms.

PRS-2 provides 100% power up to 100°C and derates to 0 at 275°C. The other four sizes provide 100% power to 25°C and derate to 0 at 275°C.

For complete information write for PRS bulletin from the firm.

Power Meter

The FXR Model B832T transistorized temperature compensated power meter is a compactly packaged instrument which will accurately measure either CW or pulsed RF power in five full scale direct reading ranges from 30 micro watts to 3 milliwatts. This is a product of **FXR, Inc.,** formerly F-R Machine Works, Inc., 26-

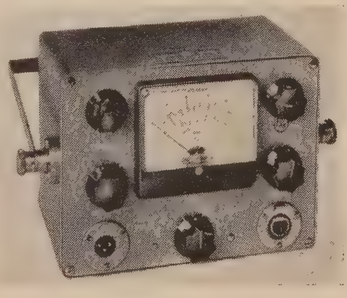
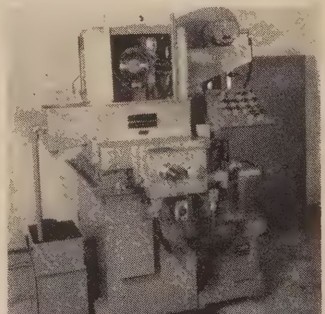
12 Borough Pl., Woodside 77, N. Y. Values can be read in MW or DBM. The instrument incorporates a unique method of controlling the accuracy and stability of RF power measurements. Readings are virtually drift free; compensation of ambient temperatures makes the instrument a hundred times more stable than comparable measuring devices, even inthe 30 microwatt range. Provision is made to calibrate the dc voltage at all levels and the bridge is self-balancing at 200 ohms. Range switching without recalibration is another advantage.



The meter is energized by a self contained rechargeable nickel cadmium battery. The charging circuit operates from a 105 to 125 volt ac, 50 to 400 cps source. The use to charge ratio is 2 to 1.

Crystal Wafer Slicer

An automatic backoff mechanism is used in an automatic semiconductor crystal slicing machine recently developed by **Fitchburg Engineering Corp.,** Fitchburg, Mass. The backoff prevents imperfections in the crystal surface.



After the spindle makes the plunge cut, the hydraulic cylinder backs the entire work support (including the indexing mechanism) 0.01 inch away from the wheel. The spindle can then be raised without marking the crystal. The cylinder also takes out blacklash in the indexing mechanism while the cut is being made.

Spindle speed is controlled up to 9,200 rpm by a Variac. Cutting wheel downspeed is regulated by a flow control valve which can be locked after adjustment. An oversized precision spindle is used to reduce diamond wheel wear. The machine's

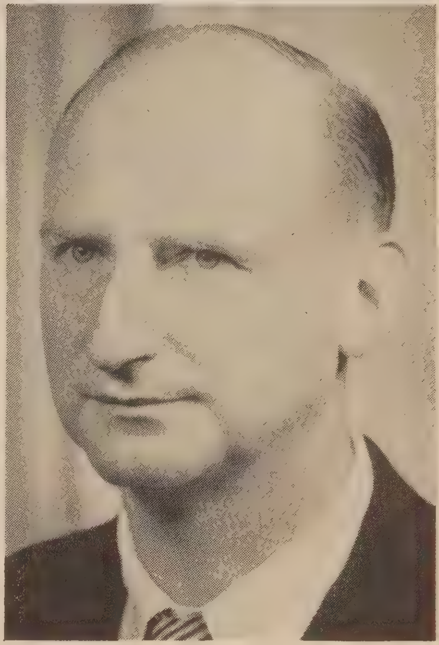
Honoring the Minds
that meet the Challenge
of the
'60s...

IRE remembers the MAN

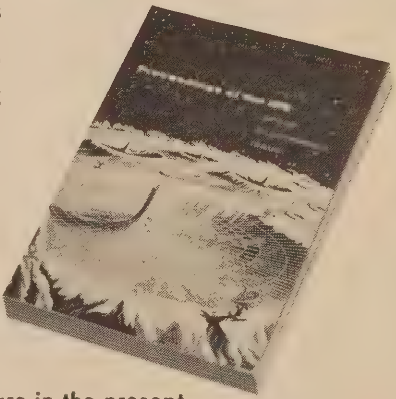
...for
Improvements in Communications

J. A. Rajchman



1960's *Morris Liebmann Memorial Prize* goes to J. A. Rajchman, of RCA Laboratories, for helping develop magnetic devices to process information. IRE is proud to honor Mr. Rajchman, and to salute all who, in this challenging decade of the '60s, work for the advancement of the radio art and apply it to the betterment of our lives.

Your company, too, has to meet the challenge of the '60s
in the vast radio-electronics field;
to do so, it too must "remember the man"
— must reach the top-level minds who control purchasing
for electronic equipment, components and supplies.
65,243 (ABC) of them read **Proceedings** every month
— ACT on what they read.
Present your company's facts in **Proceedings**
— and watch the reaction!



For a share in the present,
and a stake in the future, make your product NEWS in

McCoy

G-20 & G-21 MINIATURE

ALL-GLASS

HC-18/U TYPE

CRYSTAL UNITS

Possess all of the quality and dependability for which the McCoy line of metal encased crystal units is famous.

Check these advantages:

- ✓ Excellent Long-Term Stability
- ✓ Minimum Aging
- ✓ Choice of Leads — Pins or Flexible Wire
- ✓ Maximum Resistance to Shock and Vibration 30 vector G's from 20 to 2000 cps — vibration 100 G's — shock
- ✓ True Hermetic Seal Altitude is no problem
- ✓ Meets new CR-73/U and CR-74/U Specs
- ✓ Wide Range of Frequencies Available 5000 KC to 200,000 KC
- ✓ Extremely Small Size

Shown actual size.

G-20—Wire leads - 1 1/2" or specify.
G-21—Rigid pins - .040 dia. 1/4" long.

Write today for our free illustrated catalog which includes complete listing of military specifications. For specific needs, write, wire or phone us. Our research section is anxious to assist you.

(Continued from page 184A)

weight, 2800 pounds, helps prevent vibration.

The machine is being used by Sylvania Electric Products, Inc., Woburn, Mass. Cutting performance reported by Jack Robertson, supervisor of germanium preparation, is: wafer thickness can be adjusted from 0.025 to 0.007 inch, ±0.0005 inch. Wafers are uniform and do not break.

Two wafers may be sliced at a time from ingots up to 4 inches long. The ingots are oriented and mounted on a steel plate with adhesive. Diamond wheels from 0.01 to 0.020 inch thick are used. The coolant is water mixed with a water-soluble oil. Continuous coolant flow is provided by a constant displacement pump.

Lafferty Chief Engineer of Boonton Electronics

Boonton Electronics Corp., 738 Speedwell Ave., Morris Plains, N. J., has announced the appointment of Raymond E. Lafferty as chief engineer. Lafferty will be concerned with the design and development of new test equipment and with application engineering. He has had over 20 years of engineering experience in broadcasting and component and instrument design, and has most recently been with the Daven Company as Assistant chief engineer.

Filter Brochure

"Infratron Interference Filters" is the title of a new 4-page brochure just issued by **Infrared Industries, Inc.,** P.O. Box 42, Waltham 54, Mass.

Important performance characteristics and other unique features are described on four basic types of infrared interference filters: *Long-Pass; Short-Pass; Band-Pass;* and *Spike.*

Also described are the company's capabilities in providing highly specialized coating services for general and very specific applications.

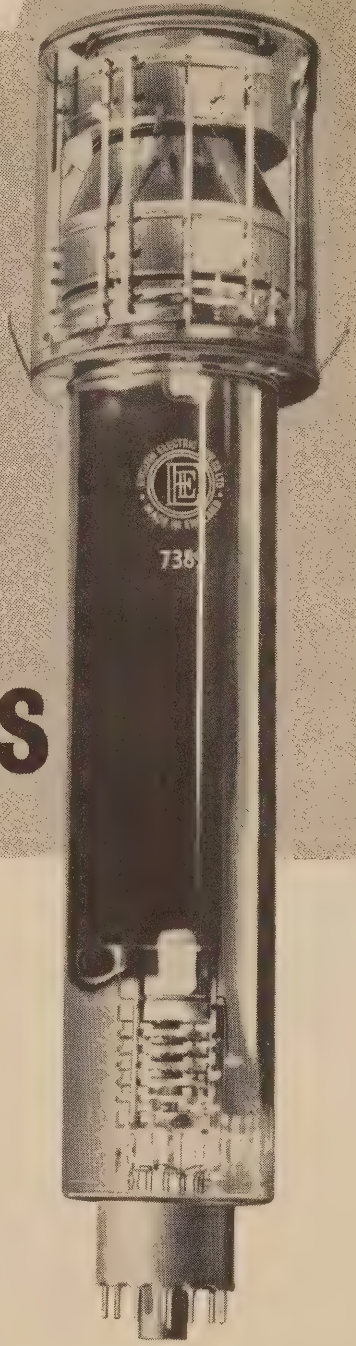
This literature is available. Please write to the firm.

Panel Meter

General Electric Co's., Schenectady 5, N. Y., line of "Big Look" ac and dc panel meters has been augmented by the addition of a new 4½ inch model.

(Continued on page 188A)

4½" IMAGE ORTHICONS



provide better picture quality than ever previously attained. Pioneered, developed and manufactured by **English Electric Valve Co.,** suppliers of Image Orthicons to the world.

'ENGLISH ELECTRIC'

AGENTS THROUGHOUT THE WORLD

ENGLISH ELECTRIC VALVE CO. LTD.

Chelmsford, England
Telephone: Chelmsford 3491

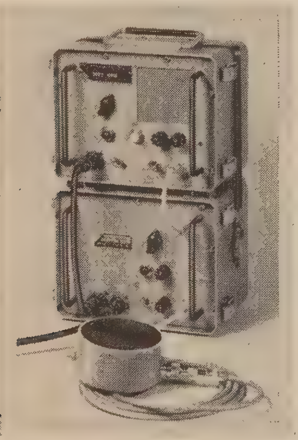
C.E.C. has for years been engaged in the design and production of quality components and systems for both military and industry. A member of our engineering group will be happy to meet with you on any microwave problems you now face.

MICROWAVE
COMPONENTS

ROTARY VANE FIXED ATTENUATORS

C.E.C. offers resistive attenuators that cover an entire waveguide band. These attenuators maintain a flat attenuation charactertistic over their entire waveguide band. ATTENUATION: 3 db, 10 db or 20 db are offered as Standard. Other attenuation values can be preset to your specifications.

INSTRUMENTS



VHF-UHF FREQUENCY CALIBRATOR MODEL 121

Range: 50 mc to 11,000 mc in crystal controlled steps of 50 or 100 mc.

Output Level: In excess of —70 dbm minimum for all markers.

Accuracy: ±0.005% at any frequency, unaffected by temperature or power input variations.

HARMONIC MULTIPLIER AMPLIFIER ADAPTER

Output Waveform: CW or Pulse.

Output Level: increases amplitude to —30 dbm in frequency range from 1,000 to 11,200 mc with marker spacing of 1,600 mc. Lower amplitude (—60 dbm) markers are generated with a spacing of 400 mc

BROADBAND ANTENNA

Designed for use with the Harmonic Adapter, this broadband antenna covers the entire range from 1,000 mc through 11,200 mc

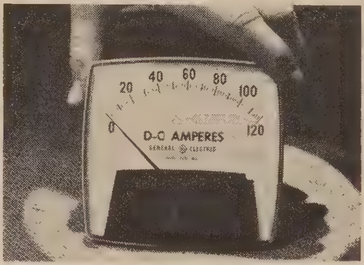
Used in combination, the three units provide a fast go-no go, remote calibration check on aircraft radar receivers, without the need for connecting cables to the aircraft.

CONTROL ELECTRONICS CO., INC.
Ten Stepar Place, Huntington Station, N.Y.

NEWS New Products

These manufacturers have invited PROCEEDINGS readers to write for literature and further technical information. Please mention your IRE affiliation.

(Continued from page 186A)



According to engineers at the company's instrument department, West Lynn, Mass., the new 4½ inch instrument incorporates the same appearance and ease of readability presently available in smaller "Big Look" panel meters. It can be supplied with custom made scales to comply with customers' appearance design or color-coding requirements.

Method of mounting is standard, conforming to the ASA C39.1 (1955) specification for 4½ inch panel meters.

The instrument will be priced competitively, and will be available from company and nation-wide distributor stocks by May 1, 1960.

Semiconductor And Microwave Devices Catalogs

Three new short-form catalogs describing **Microwave Associates, Inc.'s** products are now avilable.

For convenience the short-form catalogs cover separately (specifications, photos) the products of Microwave Associates three divisions:

Semiconductor Products manufactures Microwave Silicon Diodes, Varactors, and Computer Diodes.

Microwave Components Division manufactures Waveguide Components, Test Equipment, and Custom Engineered Microwave assemblies.

Microwave Tubes and Devices manufactures Duplexer Tubes, Magnetrons, Ferrite Devices, Coaxial Limiters, Switches, and Complete Duplexers.

Write to Department AH, Microwave Associates, South Ave., Burlington, Mass. for your copies.

Dielectric Test Bridge Literature

A four-page, two-color bulletin presents detailed information on a dielectric test bridge developed by **Rohde & Schwarz,** West Germany. It is available from **Rohde & Schwarz Sales Co. (U.S.A.), Inc.,** 111 Lexington Ave., Passaic, N. J.

Designated Type VKB, the bridge measures dissipation factors and capaci-

New LAMBDA
Regulated Power Supplies
5 and 10 AMP 0-34 VDC

CONVECTION COOLED

LAMBDA
REGULATED POWER SUPPLY
7″ ON 10 AMP MODELS
5 Year Guarantee

3½″ PANEL HEIGHT ON 5 AMP MODELS

- **Convection cooled—no internal blowers to wear out**
- **Guaranteed for a full 5 years**
- **Ambient temperature 50°C**
- **Excess ambient thermal protection**
- **Special, high purity foil, hermetically sealed long-life electrolytic capacitors**
- **Hermetically sealed transformer designed to MIL-T-27A**
- **Remote sensing and DC vernier**

New LAMBDA LA Series Condensed Data

DC OUTPUT:

(Regulated for line and load)

MODEL	VOLTAGE RANGE[1]	CURRENT RANGE[2]	PRICE
LA50-03A	0-34 VDC	0- 5A	$395
LA50-03AM	0-34 VDC	0- 5A	$425
LA100-03A	0-34 VDC	0-10A	$510
LA100-03AM	0-34 VDC	0-10A	$540

[1] The output voltage for each model is completely covered in four steps by selector switches plus vernier control and is obtained by summation of voltage steps and continuously variable DC vernier as follows:

MODEL — VOLTAGE STEPS

LA 50-03A, LA 50-03AM—2, 4, 8, 16 and 0-4 volt vernier
LA100-03A, LA100-03AM—2, 4, 8, 16 and 0-4 volt vernier

[2] Current rating applies over entire output voltage range

Regulation: Line: Better than 0.15 per cent or 20 millivolts (whichever is greater).
Load: Better than 0.15 per cent or 20 millivolts (whichever is greater).

Transient Response: Line or Load: Output voltage is constant within regulation specifications for step function line voltage change from 100-130 VAC or 130-100 VAC or for step-function load change from 0 to full load or full load to 0 within 50 microseconds after application.

Ripple and Noise: Less than 1 millivolt rms with either terminal grounded.

AC INPUT:

100-130 VAC, 60 ± 0.3 cycle. This frequency band amply covers standard commercial power lines in the United States and Canada.

OVERLOAD PROTECTION:

Electrical: Magnetic circuit breaker front panel mounted. Special transistor circuitry provides independent protection against transistor complement overload. Fuses provide internal failure protection. Unit cannot be injured by short circuit or overload.

REMOTE SENSING:

Provision is made for remote sensing to minimize effect of power output leads on DC regulation, output impedance and transient response.

PHYSICAL DATA:

Size: LA 50-03A. . .3½″ H x 19″ W x 14⅜″ D
LA100-03A. . .7″ H x 19″ W x 14⅜″ D

Panel Finish: Black ripple enamel (standard). Special finishes available to customers specifications at moderate surcharge. Quotation upon request.

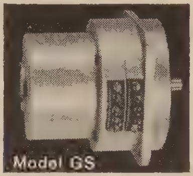
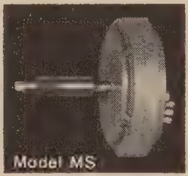
precise synchronization





±0.1 degree... no load to full load. Constant angular rotation is assured with Models GS and MS Synchronous motors. There's no "cogging" action to disturb precise synchronization. 60-pole rotor which reduces shaft speed without gearing helps provide an accuracy within 0.1 degree of angle under all load conditions.

Model GS. Incorporating an integral induction-start motor, the phonic-wheel-type GS can be operated from a vacuum tube amplifier on frequencies from 60 to 3600 cps. It may be operated single phase in the plate circuit of a single-ended amplifier or as a two-phase motor when driven by push-pull amplification. Motor current is app. 75 milliamperes per phase, output up to 1/100 hp.

Model MS. Offering big power for its small size, the MS is a phonic-wheel-type motor capable of operating on signal frequencies from 150 to 4000 cps. Power and starting characteristics on frequencies as low as 150 cps are excellent. It measures but 4"x1⅝", yet torque at 1800 rpm is as high as 6 inch ounces per phase.

Investigate the superior performance characteristics these advanced synchronous motors offer. They are a product of one of the world's leaders in the development and manufacture of facsimile and radio communications equipment.

Westrex Corporation

A DIVISION OF LITTON INDUSTRIES

540 West 58th St., New York 19, N. Y., 1523 L St., N.W., Washington 5, D. C.

(Continued from page 188A)

tances of any kind of capacitors between 10 $\mu\mu$f and 1 μf. It finds special application in the investigation of insulating materials, since it permits determination of the dielectric constant and the dissipation factor of solid or liquid specimens. The bridge is equipped with guard circuit for measurement of three and two terminal capacitors.

Of particular interest are the sample holders described in the bulletin which are available for measuring the dissipation factor of solid and liquid material and of the insulation of wire. There is also available an extension unit for determining large dissipation factors.

Accuracy of dissipation factor and capacitance measurements are discussed, ranging from ±4 to ±7% for the former and ±1 to 2±% for the latter.

Telemetal Names Kent

Jack H. Kent has been appointed general manager of **Telemetal Products, Inc.,** 75 N. 11 St., Brooklyn, N. Y., a subsidiary of Polarad Electronics Corporation. In his new capacity he will be responsible for the over-all operation of the Telemetal organization. Kent was formerly with Landau Metal Products, Inc. He has a wide background encompassing twenty years of experience both in engineering and manufacturing phases of the sheet metal industry.

Telemetal Products, Inc., founded in 1951, manufactures a wide variety of precision sheet metal assemblies for both industry and the military.

Transistorized RF Voltage Calibrator

Kay Electric Co., Dept. PI, 14 Maple Ave., Pine Brook, N. J., has announced the development of the Megavolter, a fully transistorized RF Voltage Calibrator for use in obtaining voltage calibrations of RF signal generators and vacuum tube voltmeters.

Megavolter
KAY ELECTRIC CO. PINE BROOK, N.J.

NUMBER 5—RELIABILITY SERIES

Bourns Trimpot®
Puts the Proof in Humidity-Proof

Plunging a potentiometer into near-boiling water is just one of the ways Bourns puts the proof in humidity-proof. Every Trimpot unit made takes this 60-second bath with the water simmering at 90°C. Air expanded by the heat creates four pounds of pressure inside the potentiometer—enough to cause bubbles—if it leaks. Only if the unit is completely leak-free does it pass the test.

Bourns humidity proofing starts at the beginning—with original design and selection of materials. The plastic chosen for Trimpot cases, for example, displays the unusual properties of high insulation resistance and extremely low moisture absorption. Further protection against humidity results from manufacturing procedures, such as internal potting of the resistance element and sub-components. Finally, Bourns samples all production for compliance to MIL-STD-202A, Method 106 as a routine part of a Reliability Assurance Program. As a result, Trimpot does more than "resist" moisture; it keeps moisture out.

For more information about the industry's largest selection of humidity-proof adjustment potentiometers—wirewound and carbon in a variety of sizes, power ratings, operating temperatures, etc.—write for new Trimpot summary brochure and list of stocking distributors.

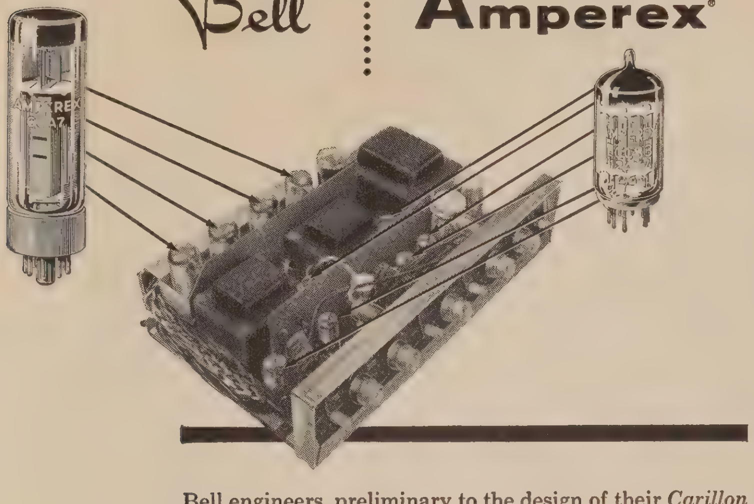
2 for the money

circuit by Bell

tubes by Amperex®



Bell engineers, preliminary to the design of their *Carillon Model 6060, 2 channel, 60 watt Stereo Amplifier,* canvassed the industry for tube types offering something truly exceptional in the way of reliability, low distortion, low noise, low hum and absence of microphonics.

As has frequently been their experience, the people at Bell found these qualities best exemplified by Amperex tubes. Thus, the tube complement of the Bell Model 6060 includes two Amperex 6CA7/EL34's and three Amperex 12AX7/ECC83's in each channel.

These and many other Amperex 'preferred' tube types have proven their reliability and unique design advantages in the world's finest audio components.

Applications engineering assistance and detailed data are always available to equipment manufacturers. Write: Amperex Electronic Corp., Special Purpose Tube Division, 230 Duffy Avenue, Hicksville, L. I., New York.

These manufacturers have invited PROCEEDINGS readers to write for literature and further technical information. Please mention your IRE affiliation.

(Continued from page 190A)

The lightweight, compact Megavolter can be used right on the production line, without the aid of expensive and delicate external voltage standards, to obtain readings of 1% accuracy to 10 mc; 2% accuracy to 50 mc; 3% accuracy to 200 mc and measure from 1 millivolt to 1-volt rms from 1 kc to 200 mc.

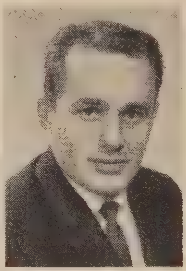
This instrument is a complete comparison measurement device, utilizing the principle that both 1-volt dc and 1-volt rms develop equal power (heating) in a given thermal element.

When used to calibrate voltage output of RF signal generators, the output voltage is read directly on the meter in error voltage percentage, as referenced to 1 volt. Full scale error voltage input of 0.0 to 1.1-volt rms can be read.

For calibrating RF VTVM's, precise voltages are available at panel terminals between 0.001 and 1-volt rms, referenced to 1-volt rms input. Several voltage points may be checked on each side of the VTVM being calibrated.

Acton Labs. Appoints Webber and Swanson

Acton Laboratories, Inc., subsdiary of Technology Instrument Corp. of Acton, Mass., announced the promotion of Donald W. Webber to western sales manager and Stanley C. Swanson to eastern sales manager.



D. W. Webber

S. C. Swanson

Webber has been Sales Engineer for Acton's Electronic Instruments and Communication Equipment in Los Angeles. His headquarters will be 1225 West Olympic Blvd., Los Angeles, and he will be responsible for sales in the West Coast and Rocky Mountain Area.

Swanson was formerly a Sales Engineer. He will now be responsible for sales in the Eastern part of the United States with headquarters in Acton, Mass.

Lambert Operations Manager of Electronic Controls

J. B. Lambert was appointed operations manager of **Electronic Controls Inc.,** 85 Magee Ave., Stamford, Conn. Lambert

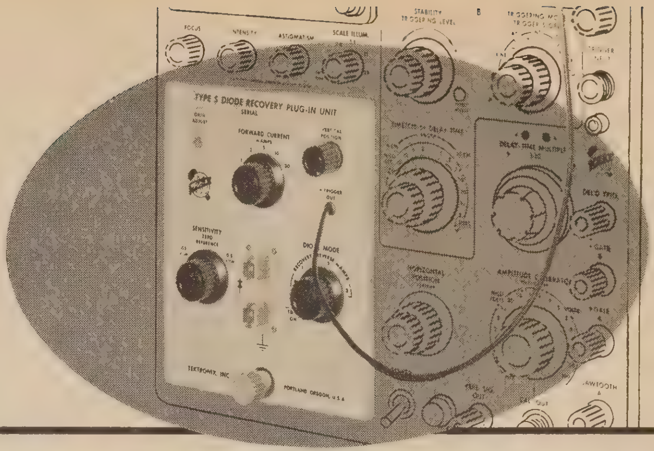
NEW SEMICONDUCTOR-DIODE Test Unit for measuring recovery characteristics



TEKTRONIX TYPE S PLUG-IN UNIT

You can now display semiconductor-diode switching characteristics on your Tektronix Plug-In Oscilloscope. With Tektronix Type 540-Series and Type 550-Series Oscilloscopes you can find:

Effective lifetimes to 2 nanoseconds
Stored charge to 10 picocoulombs
Junction capacitance to 2 picofarads
Base resistance to 0.25 ohm

The Type S Unit describes the diode in terms of its parameters, while most other currently employed methods describe the diode in terms of its performance in a particular circuit—not necessarily the one in which it will be used. With the Type S method you can predict the behavior of many diodes in many circuits, as well as compare diodes for performance in a particular circuit.

A Type S Unit, plugged into your Tektronix Oscilloscope, can save you many hours of experimentation. Call your Tektronix Field Engineer for a demonstration in your application.

MAIN CHARACTERISTICS

Calibrated Forward Currents
1, 2, 5, 10, and 20 milliamps.
Calibrated Reverse Currents
0, 0.1, 0.2, 0.5, 1, and 2 milliamps.
Diode Shunt Capacitance
9 picofarads.
Amplifier Sensitivity
0.05 v/cm and 0.5 v/cm, calibrated.

Type S Diode Recovery Unit **$250**
f.o.b. factory

Note: Risetime of the Type S Unit depends on the capabilities of the oscilloscope with which it is used, therefore the ability to analyze fast diodes with Tektronix Type 530-Series Oscilloscopes will be affected by the lower risetimes of these instruments.

Tektronix, Inc.

P. O. Box 500 • Beaverton, Oregon
Phone MItchell 4-0161 • TWX—BEAV 311 • Cable: TEKTRONIX

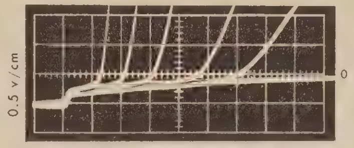


Fig. 1—Diode A

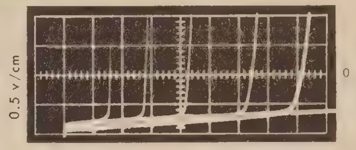

Fig. 2—Diode B

I forward—10 ma. I reverse—2, 1, 0.5, 0.2, 0.1, 0 ma.

Observation of the recovery curves of Figures 1 & 2 shows both reverse current and recombination accounting for removal of the stored charge. It is thus possible to determine not only the stored charge for any of the five forward currents available, but also the rate of recombination. With this information, it is possible to predict diode action to fast transients in any circuit.

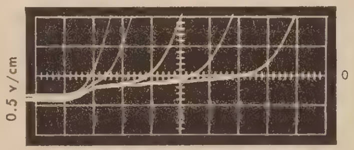

Fig. 3—Diode A

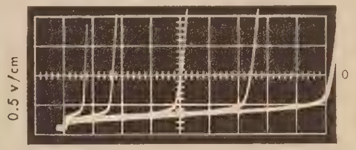

Fig. 4—Diode B

I forward—1, 2, 5, 10, 20 ma. I reverse—2 ma.

Observation of the recovery curves of Figures 3 & 4 shows that the amount of stored charge is proportional to forward current while the recovery time is so short that negligible recombination occurs. Under this condition, after the stored charge is cleared the reverse bias increase is limited only by the diode capacitance (and the shunt capacitance of the instrument). This rate of increase is easily measured at a particular reverse voltage, and thus, the diode capacitance at that voltage can also be determined.

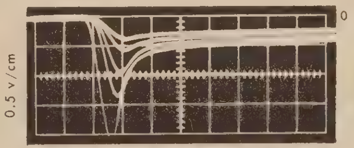

Fig. 5—Diode A

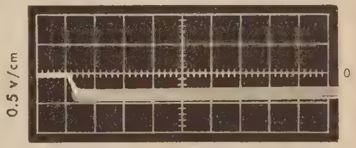

Fig. 6—Diode C

Turn-on—magnified. I forward—1, 2, 5, 10, 20 ma.

Observation of the turn-on characteristics of Figures 5 & 6 shows that the voltage drop across a diode suddenly switched on is not always initially as low as the steady-state drop. It is important to remember that the leading edge of any fast transient passed by a diode may be modified by this phenomenon.

NOTE: The above waveform photos are multiple exposures.

NEWS New Products

These manufacturers have invited PROCEEDINGS readers to write for literature and further technical information. Please mention your IRE affiliation.

(Continued from page 192A)

will expand and manage the company's sales, manufacturing and administrative departments in keeping with a planned program for growth.

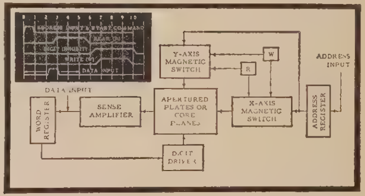
He has received both a Bachelor of Mechanical Engineering and a Bachelor of Science in Business Administration from Kansas State University. In addition, he has had further education in these fields at Bridgeport Engineering Institute and Cornell University.

After graduating from Midshipmen's school as honorary company sub-commander Lambert served as assistant gunnery officer on a destroyer in the Pacific. Upon completion of his military duties, he was employed as an engineer by the Yale & Towne Manufacturing Company and subsequently during a period of 8 years with the Burndy Corporation served in various management positions related to both manufacturing and sales. Lambert was directly responsible for the design and production of electrical devices for various Aircraft and Missile applications.

Coincident-Current Magnetic Memories

Rese Engineering, Inc., 731 Arch St., Philadelphia 6, Pa., announces Series 3100 Magnetic Memories, high speed coincident-current, random access storage units with a range of storage capacities from 128 to 4096 words and from 4 to 64 bits per word, permitting exact match of memory to arithmetic operations and instruction storage, editing, telemetering, multiplexing and data distribution, communication links and displays, and a multitude of data processing and control equipment.

Operating with adddress to address cycles as low as 10 microseconds, these transistor operated memories accept digital information either synchronously or asynchronously, store the information in randomly specified or sequential addresses, and can be supplied with binary or binary coded decimal address.



Series 3100 Magnetic Memories require only data and address signals and a read or write cycle start pulse from external data processing equipment. Input signals may be pulses or levels at 0 or −6 volts. When sequential address is made to each storage location, the address register is operated as a counter, relieving the external equipment of certain circuit requirements. Stored information is held indefinitely, or until recalled by the external data processing equipment, when it may be called up in random or sequential order. Input-output data may be transferred in parallel or in series by an in-out shift register, which also serves as the regeneration register. Output data is taken as a level from flip-flop register at 0 or −6 volts.

PRECISION
Model 120
VOLT-OHM-MILLIAMMETER

And Why It Was Chosen By

The Long Island Rail Road

The Problem:

The Long Island Rail Road needed a rugged, portable, all-purpose field analyzer for checking signal relays and line circuits . . . and for measuring and adjusting both AC and DC track circuit voltages.

The Solution:

After evaluating all available test instruments, the ***PRECISION*** Model 120 was chosen for its reliability and accuracy . . . and for the fact that it was so versatile that it could do a job that formerly required the use of several different test instruments.

Model 120

VOLT-OHM-MILLIAMMETER WITH MIRRORED-SCALE
20,000 OHMS-PER-VOLT DC • 5,000 OHMS-PER-VOLT AC

61 RANGES start lower and go higher than other instruments of its size and type
EXTRA-LOW RESISTANCE RANGE 2 ohms at center scale (R x 1/10)
EXTRA-LOW VOLTAGE RANGES 0.3 V full scale DC, 1.2 V full scale AC
EXTENDED LOW-CURRENT RANGE 60 μA first DC range
DC POLARITY REVERSING SWITCH
WIDE FREQUENCY RESPONSES AC AND DB RANGES flat from 15 cps to 100 Kc±1 Db
"TRANSIT" POSITION ON RANGE SELECTOR protects meter during transportation
ONLY 2 PLUG-JACKS SERVE ALL STANDARD RANGES
RUGGED 50 MICROAMP PACE METER ±2% accuracy
1% MULTIPLIERS AND SHUNTS
WEIGHT 4 lbs. **PRICE $44.95**

Chances are you have a field maintenance, production or servicing problem that can be solved by the ***PRECISION*** 120.

If so, you will be interested to learn that the Model 120, and all other ***PRECISION*** test instruments, are available to you now, for a *free trial . . . in your plant . . . under actual operating conditions . . . without obligation.*

For complete information...*plus* a copy of the comprehensive, new ***PRECISION TEST INSTRUMENT CATALOG,*** write on your company letterhead to:

instrumentation
is the only
answer
WHERE
PRECISION
COUNTS...!

You can depend on ELIN to meet your precision AC power requirements on gyros, bridge-type transducers, synchros, servo systems, resolvers and many other AC devices.
Ask about the new load-regulated amplifiers for production line testing. External sync. provides master-remote features without sacrifice in over-all stability. Complete power systems available for your specific needs.

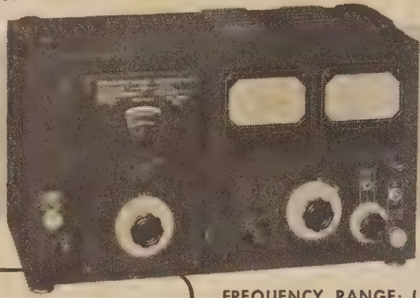
EXTENDED *FREQUENCY RANGE*

with these STANDARD SIGNAL GENERATORS



MODEL 80
2 Mc to 400 Mc

MODEL 80-R
5 Mc to 475 Mc

FEATURES

- Direct-Reading scales and dials; individually calibrated.
- Convenient microvolt and DBM output scales.
- Accurate indication of output voltages at all levels.
- Low residual FM due to hum and noise.
- Provision for external pulse modulation.

SPECIFICATIONS

FREQUENCY RANGE: (Model 80) 2 to 400 Mc in 6 bands.
(Model 80-R) 5 to 475 Mc in 6 bands.

FREQUENCY ACCURACY: ± 0.5%

FREQUENCY DRIFT: Less than .1% after warm-up.

OUTPUT VOLTAGE: Continuously variable from 0.1 to 100,000 microvolts (−7 to −127 DBM).

OUTPUT ACCURACY: ±10% at 0.1 volt from 5 to 200 Mc.
±15% at 0.1 volt from 200 to 475 Mc.

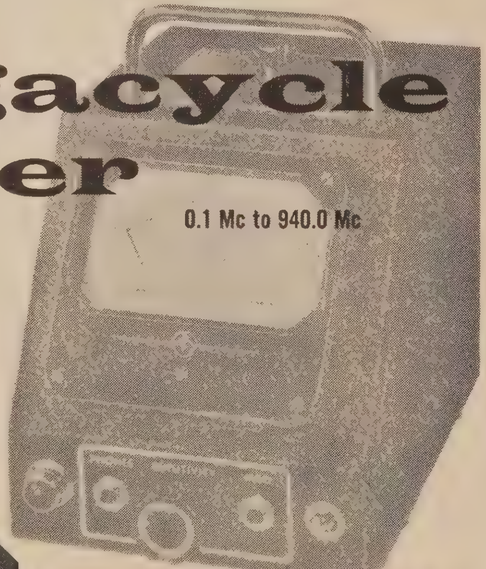
MODULATION: AM is continuously variable from 0 to 30%.
Internal modulation, 400 and 1000 cycles.
External modulation, 50 to 10,000 cycles.

RESIDUAL FM: Less than 500 cps at 450 Mc for Model 80-R, and correspondingly lower for both models at lower frequencies.

POWER SUPPLY: 117v, 50-60 cycles, 70 watts.

STILL THE BEST VALUE IN A SIGNAL GENERATOR—PRICE OF THE MODEL 80 IS $590, UNCHANGED SINCE 1945.

Megacycle Meter



0.1 Mc to 940.0 Mc

Determines resonant frequency of tuned circuits, antennas, transmission lines, by-pass condensers, chokes, etc. Measures inductance and capacitance. Also used as a signal generator, wave meter, frequency meter, and in many other applications.

This compact, lightweight grid-dip meter is available in the frequency ranges indicated.

Standard Model 59 complete	$168.00
UHF Model complete	$198.00
LF Model complete	$168.00
Combination all ranges	$380.00

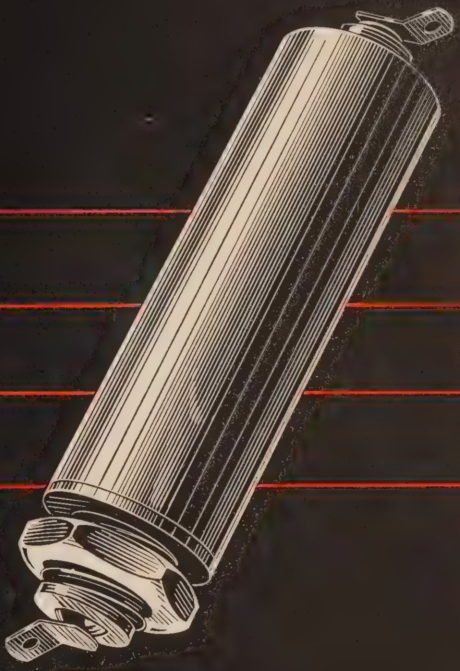
CDE *Consistently Dependable Capacitors*



miniaturized pi filters suppress electronic interference from 150 kc to 10,000 mc

C-D *miniaturized* tubular pi filters and 3-terminal feed-thru capacitors suppress electronic interference effectively at any frequency from 150 kc to 10,000 mc. Regardless of your design requirements, the C-D Filter Laboratories can supply you with the exact suppression component you need with tubular shapes, neck-mounting designs and smallest possible case sizes to save space and weight, enable easy installation. C-D miniaturized pi filters and feed-thru capacitors also provide better insertion loss per unit volume, weight and cost as compared to other types of suppression devices at identical ratings.

To obtain complete engineering data and specifications, write for Engineering Bulletins 171, 172 and 166 to Cornell-Dubilier Electric Corporation, South Plainfield, New Jersey. *Manufacturers of consistently dependable capacitors, filters and networks for electronics, thermonucleonics, broadcasting and utility use for 50 years.*

SPECIFICATIONS

Tubular Pi Filter TYPE NFR113

Voltage: 120 VAC (60 cycles), 300 VDC
Current: 0.5 Amperes
Dimensions: 1″ x $2\frac{11}{16}$″ Weight: 4.0 oz.

Feed-Through Capacitor TYPE NFT5W4P22W

Voltage: 125 VAC (60 cycles), 400 VDC
Current: 25.0 Amperes
Capacitance: 0.22 mfd.
Dimensions: $\frac{9}{16}$″ x $1\frac{29}{32}$″ Weight: 0.83 oz.

. . . two 6.3v, ac, unregulated outputs at 5a each
(may be connected in series or parallel)

. . . all from a compact package

120 Watts in 0.2 Cubic-Foot Package . . . Excellent performance is obtained by using two regulator circuits. A high-efficiency controlled rectifier maintains the optimum operating voltage for a series regulator, regardless of line-voltage changes, load changes, or changes in output voltage setting. Wide-band regulator circuits and high-frequency by-passing of the output make for low output impedance over a wide frequency range. A large capacity fan provides cooling without dependence on convection, permitting the stacking of any number of units.

AUTHOR INDEX

A name followed by "and" is that of the first author of a jointly written paper, while the word "with" indicates that the name indexed is that of the second author.

A

Aaron, M. R., *with J. A. Narud*, transistor blocking oscillator, **2504**
Abbott, W. N., displacements of radiant point during auroral disturbance, **138**; seasonal illumination of circumpolar earth satellite, **793**
Abdullaev, G. B., *and A. A. Bashshaliev*, thermal conductivity of Se, **1606**
Abe, H., paramagnetic resonance in copper propionate monohydrate, **98**
Abel, J. L., *with A. G. Chynoweth*, polarization reversal in triglycine sulphate, **3742**
Abkevich, I. I., distribution of slow traps on surface of Ge and Si, **3768**
Abraham, M., *M. A. H. McCousland and F. N. H. Robinson*, dynamic nuclear polarization, **3412**
Abrikosov, A. A., *L. P. Gor'kov and I. M. Khalatnikov*, superconductor in high-frequency field, **2195**
Abrikosov, N. Kh., *with L. D. Dudkin*, alloying of semiconductor compound $CoSb_3$, **2667**
Acheson, M. A., interaction reliability, **1038**
Adams, E., *with others*, sendust flake, **894**
Adams, I., *with others*, electroluminescence of AlN, **4082**
Adams, J. A., miss-distance indicator, **2601**
Adcock, F., radio direction finding in three dimensions, **3314**
Addington, R. E., *with A. J. Goss*, effects of seed rotation on Si crystals, **3021**
Adirovich, E. I., *and K. V. Temko*, transition frequency and phase characteristics of transistor, **634**
— *Yu. S. Ryabinkin and K. V. Temko*, field potential and charge carriers in fused-in junctions, **3787**
Adlam, J. H., *and J. E. Allen*, structure of collision-free hydromagnetic waves, **1162**
Adler, R., *and G. Hrbek*, low-noise electron-beam parametric amplifier, **321**
— *with G. Wade*, method for pumping fast space-charge wave, **1412**
Agarwal, P. D., eddy current losses in Fe, **4130**
der Agobian, R., detection of non-ionizing shock waves, **3447**
— *and L. Lifschitz*, propagation of non-ionizing shock waves, **4016**
Agostinelli, C., spherical vortices in magneto-hydrodynamics, **92**
Agranovich, V. M., *and A. A. Rukhadze*, propagation of e.m. waves in medium with spatial dispersion, **2921**
— *V. E. Pafomov and A. A. Rukhadze*, Cherenkov radiation in medium with spatial dispersion, **3648**
Agranovskaya, A. I., *with others*, nonferroelectric phase transitions in solid solutions, **1912**; effect of polarization on $Pb_2NiNb_2O_9$-$Pb_3MgNb_2O_9$, **2631**; new ferroelectric, **2632**
Agrawal, D. B., *with M. S. Sodha*, low-field mobility of carriers in nondegenerate semiconductors, **164**
Agusta, B., sorting components by measuring waveforms, **1645**
Ahaćić, A., reactance transformation of low-pass ladder networks, **2152**
Ahlstrom, E., *W. G. Matthei and W. W. Gärtner*, surface-barrier photodiodes as photocapacitors, **3885**
Ahmed, R., *with R. Fatehchand*, electronic speech sampler, **2820**
Aiken, W. R., flat rectangular c.r. tube, **3171**
Ainsworth, J., *with F. H. Harris*, single-line-scan television, **2033**
Aitchison, C. S., frequency synchronization of reflex klystron, **3524** *y*
Aitchison, G. J., *and K. Weekes*, ionospheric information from observations of satellite 1957 α2, **3296**
— *J. H. Thomson and K. Weekes*, ionospheric information from observations of satellite 1957 α2, **3297**
Aitchison, R. E., breakdown voltage of Ge transistors, **3519**
— *with C. T. Murray*, high-stability valve heater supply, **1697**
Aitken, D. K., long-transit-time multipactoring at u.h.f., **3524** *c*
Aiya, S. V. C., average power of impulsive atmospheric noise, **1354**
Akimoto, S., *T. Katsura and M. Yoshida*, magnetic properties of $TiFe_2O_4$-Fe_3O_4 system, **542**
Akita, K., *with others*, temperature fluctuations accompanying solar eclipse, **2559**
Akulov, N. S., *and A. V. Cheremushkina*, Hall effect at Curie point, **2680**
Albanese, V. J., *and W. P. Peyser*, analysis of a broad-band coaxial hybrid ring, **3552**
Albrecht, H. J., instrument effects in ionosphere data, **807**, great-circle propagation between Australia and Europe, **2727**
Alcock, B. J., 4-pole analysis for transistors, **48**
Aldrich, R. W., *and N. Holonyak, Jr*, Si-controlled rectifiers from oxide-masked diffused structures, **2418**
Aleksandrov, V. T., *with S. V. Svechnikov*, photoelectric properties of CdSe and CdTe, **468**
Alekseeva, V. G., *and others*, influence of group III and V elements on recombination in Ge, **1614**
Alers, G. A., *J. R. Neighbours and H. Sato*, dependence of sound attenuation on magnetization direction in Ni, **4125**
Alexander, W. M., *with others*, rotating-disk function generator, **2858**
Alimov, Yu. I., *with G. V. Skrotskii*, ferromagnetic resonance in circularly polarized e.m. field, **3646**
Allan, A. H., *and J. E. Drummond*, Doppler measurements on Soviet satellites, **443**
Allan, D. W., reversals of earth's magnetic field, **436**
Allanson, J. T., network synthesis, **1113**; synthesis of *LC* networks, **2147**; network characteristics, **2496**
Allcock, G. McK., electron density distribution in outer ionosphere, **3307**
— *and M. G. Morgan*, solar activity with whistler dispersion, **144**
Allen, C. P., *and M. Sherry*, measurement of magnetic flux density, **3056**
Allen, E. J., frequency-shift telegraph receiver, **1675**
Allen, J. E., *with J. H. Adlam*, structure of collision-free hydromagnetic waves, **1162**
Allen, J. W., delay time in plastic flow of InSb, **3387**
— *and F. A. Cunnell*, diffusion of Zn in GaAs, **1259**
Allen, P. J., *and R. D. Tompkins*, instantaneous microwave polarimeter, **3432**
Allerton, G. L., microwave directional couplers, **3936**
Allgaier, R. S., magnetoresistance in PbS, PbSe and PbTe, **1267**
— *and W. W. Scanlon*, mobility in PbS, PbSe and PbTe, **181**
Allin, P. E. V., tuning of coupled-cavity reflex klystrons, **3524** *cc*
Allred, W. P., *with others*, preparation and characteristics of single-crystal InP, **4114**
Allsopp, H. L., *and D. F. Gibbs*, electromechanical properties of $BaTiO_3$, **3333**
Almer, F. H. R., *and P. G. Van Zanten*, transistor pyrometer, **3424**
Al'pert, Ya. L., ionosphere and artificial satellites, **1873**; conditions in outer ionosphere, **2967**; investigation of ionosphere by earth satellite, **3295**
— *and others*, electron concentration of ionosphere from observations of first earth satellite, **3298**
van Alphen, P. M., interference of light in thin films, **1701**
Alsop, L. E., *with others*, maser amplifier for radio astronomy, **2892**
Ament, W. S., airborne radiometeorological research, **2726**
— *with others*, measurements of 1250-Mc/s scatter propagation, **3096**
Amer, S., nonlinear theory of plasma oscillations, **88**
Ames, L. A., *and T. F. Rogers*, 220-Mc/s reception at 700–1000 miles, **1351**
— *E. J. Martin and T. F. Rogers*, persistent v.h.f. field strengths beyond radio horizon, **2737**
Amster, L., *with others*, echo in television images, **3134**
Anan'eva, A. A., calculations for piston-type piezoelectric radiator, **1045**
Anastassiades, M., *and L. Carapiperis*, influence of meteorological factors on u.h.f. propagation, **1333** *m*
— *C. Caroumbalos and C. Bouloheris*, optimum radiation from sawtooth aerial, **3578**
Anders, H., transistor video amplifier, **4214**
Anderson, D. A., CdS and CdSe photistors, **1011**
Anderson, D. G., luminescence and luminescent materials, **1595**
Anderson, J. C., surface impedance, **1306**
— *and B. Donovan*, internal ferromagnetic resonance in Ni, **2684**
— *and T. Winer*, temperature-stabilized phototransistor relay circuit, **1109**
Anderson, J. T., orbit of artificial satellite, **4047**
Anderson, K. A., radiation associated with solar radio noise storm, **429**
Anderson, L. J., *with L. G. Trolese*, foreground terrain effects, **3457**
Anderson, L. K., *and A. Hendry*, Ge mixer crystals at low temperatures, **3876**
Anderson, M. E., magnetic head reads tape at zero speed, **2020**
Anderson, O., *and others*, hydromagnetic capacitor, **1843**
Anderson, P. W., spectral diffusion, phonons and paramagnetic relaxation, **3652**
Anderson, S. R., *and R. B. Flint*, C. A. A. Doppler omnirange, **2610**
Anderson, W. P., *and N. A. Godel*, latching counters, **58**
Ando, K., *and others*, oxide-cored cathode, **3078**
André, P., *with others*, influence of high-energy electron bombardment on Ge, **3773**
Andreasen, M. G., propagation of fundamental modes in curved waveguides, **3929**
de Andrés, M. P., *with W. Jellinghaus*, crystal anisotropy and magnetostriction with Hall effect, **3803**
Andresciani, V., *D. Sette and S. Tiberio*, characteristic parameters of barrier layer in metal/semiconductor junction diodes, **2415**
Andrews, P., electroforming of waveguide components, **1436**; broad-band circular wavemeters, **3066**
Andrich, W., *with K. Küpfmüller*, speech transmission with quantization, **3855**
Angel, Y., *and G. A. Boutry*, parametric amplifiers and cancellation of ferromagnetic hysteresis, **3244**
Angell, B. C., *and others*, propagation measurements at 3480 Mc/s, **2000** *r*
Angstadt, R. T., *with P. Rüetschi*, self-discharge reactions in batteries, **2403**
Angulo, C. M., *and W. S. C. Chang*, excitation of dielectric rod by cylindrical waveguide, **3558**
Anisimova, Yu. V., *with R. G. Mirimanov*, circular waveguide partially filled with ferrite, **2116**
Anson, W. J., *with others*, water cooling of low-power klystrons, **312**
Antes, L. L., progress in CdS, **829**
Aoi, S., *and others*, magnetrons for mm λ, **4248**
Aono, Y., *and K. Kawakami*, cosmic rays observed by satellite 1958 α, **448**
Aoyagi, K., *with others*, ferromagnetic domain structure in Co-Ni crystal, **192**
Apker, L., *with others*, exciton-induced photoemission from BaO, **2264**
Apple, E. F., *with others*, two-stage optical excitation in phosphors, **2996**
Applebaum, M., *and E. Midgley*, f.m. receiver using transistors, **4188**
Appleton, E. V., E region of ionosphere, **1554**
Arai, M., *with others*, mutually coupled *CR*-type directional coupler, **9**
Araki, T., *with others*, effect of solar eclipse on geomagnetic field, **2562**
Arams, F. R., low-field ruby maser, **3624**
— *and G. Krayer*, low-loss L-band circulator, **1769**
— *and S. Okwit*, tunable L-band ruby maser, **2523**
Arbell, H., *with A. Halperin*, excitation spectra and luminescence of ZnS, **2999**
Archer, R. W., *with A. M. Thompson*, comparator for 100-kc/s frequency standards, **1299**
von Ardenne, M., *and H. B. Sprung*, ingestible intestinal transmitter, **1327**, **3834**
Arendt, P. R., magneto-ionic effect above F layer, **2961**; measurements on Doppler shift of satellite emissions, **3697**
Arguimbau, L. B., f.m. multiplex spectra and interference, **3857**
Aries, R., Ta capacitors, **2137**
Arima, Y., *with T. Yonezawa*, F_2 layer, semidiurnal lunar variations of, **1196**, variations in electron density of, **4055**
— *with others*, electron and ion density distributions in F region, **2579**
Armstrong, E. B., temperature of atmosphere emitting nightglow, **1877**
Armstrong, G. T., *P. K. Wong and L. A. Krieger*, use of d.c. amplifier and recorder to balance resistance bridge, **3061**
Armstrong, H. L., avalanche multiplication in semiconductor devices, **186**; revision in transistor terminology, **1008**; transconductance as transistor parameter, **1403**
Armstrong, R. J., electrical recovery of gas after pulse discharge, **2531**; eddy-current heating, **2716**
Armstrong, R. L., *with M. S. Rao*, radio reflections along meteor train, **2226**
Arnaud, J., *and R. Warnecke*, increase of bandwidth in O-type travelling-wave valves, **317**
— *with P. Palluel*, results on delay lines for travelling-wave tubes, **3159** *s*
with others, characteristics of carmatron tube, **2788** *r*
Arnold, J. S., *and J. G. Martner*, resonances of $BaTiO_3$ cylinders, **2446**
Arnoldy, R., *with others*, auroral phenomena during storm, **3309**
Aroyan, G. F., spatial filtering, **4165**
Arp, F., *with others*, perceptibility of image details in television, **3136**; visual properties of human eye, **3138**
Arthur, J. B., *and others*, minority carriers in dislocated Ge, **1618**
Artman, J. O., *with others*, cross-relaxation in spin systems, **3270**
Arzeliès, H., *and J. Henry*, laws of magnetism and static electricity, **1514**
Asaba, T., *with M. Nishimaki*, discharge machining for mm-wave magnetrons, **3159** *e*
Asanabe, S., electrical properties of SnSe, **3389**
— *and A. Okazaki*, Hall coefficients of SnSe and GeSe, **2669**
Asch, G., magnetic resonance of polycrystalline Co, **3802**
Aschen, R., passive television relay, **2851**; passive relay by microwave mirror, **2852**
— *with L. Chrétien*, compatible system for colour television, **1700**; synchrophase, **3116**
Ash, E. A., magnitude of locking signal for backward-wave oscillators, **2788** *bb*; slow-wave structure for mm λ, **3159** *u*
— *and J. D. Pattenden*, modified transmission-line couplers for helices, **3159** *y*
Ashby, D. E. T. F., wave matrices applied to periodically loaded travelling-wave tube, **1020**
— *and R. B. Dyott*, measuring modulation noise of c.w. klystron amplifier, **3524** *k*
Ashkin, A., parametric amplification of space-charge waves, **1025**; dynamics of electron beams from magnetically shielded guns, **1031**
— *and others*, parametric amplification of space-charge waves, **3159** *k*
Aspinwall, J. F. H., 'third' method, **970**
Assaly, R. N., dielectric sphere as microwave lens, **714**
d'Ast, L., *with F. Perrier*, rapid testing of direct-voltage stabilizers, **608**
Atal, B. S., method of calculating reverberation-chamber coefficients, **3921**
Atalla, M. M., *E. Tannenbaum and E. J. Scheibner*, stabilization of Si surfaces by thermally grown oxides, **2650**
Athavale, V. N., *with M. W. Chiplonkar*, recording of atmospherics in l.f. region, **813**
Atiya, F. S., band-pass amplifiers, **2512**
Atkinson, M. P., *W. T. Bane and D. L. A. Barber*, automatic graph plotter, **2859**
Atlas, D., meteorological 'angel' echoes, **2603**
Atwood, J. B., *and others*, 468-Mc/s tropospheric scatter propagation, **245**
Audoin, C., *with R. P. Musson-Genon*, electronic hysteresis and secondary emission in reflex klystrons, **3524** *gg*
Auer, P. L., *and H. Hurwitz, Jr*, space-charge neutralization in diodes, **2432**
— *H. Hurwitz, Jr, and S. Tamor*, theory of cathode sheath in discharge, **82**
Augustyniak, W. M., *with W. L. Brown*, defect formation in electron irradiation of *n*-type Ge, **4110**
— *with others*, annealing of radiation defects in semiconductors, **4089** *o*
Aukerman, L. W., radiation-produced energy levels in semiconductors, **4089** *m*
Ault, C. F., digital-to-analogue conversion for storage-tube deflection, **2135**
Austin, I. G., optical properties of Bi_2Te_3, **533**; Faraday effect in anisotropic semiconductors, **3018**
Austin, N. A., *and S. C. Fultz*, 22-MeV electron linear accelerator, **2719**
Autler, S. H., maser amplifier system, **388**
Avak'yants, G. M., theory of transfer phenomena on semiconductor surface, **2280**
Avignon, Y., *and M. Pick*, relation between type-IV emissions and other solar activity, **3283**
Avins, J., *T. Brady and F. Smith*, synchronous and exalted-carrier detection, **1378**
Awender, H., crystal-resonator techniques, **2142**
— *and A. Ludloff*, crystal-controlled transistor oscillators, **1129**
Ayakawa, T., *with others*, life tests of microphone carbon, **1758**
Ayres, W. P., broad-band λ/4 plates, **1081**; mm-wave generation utilizing ferrites, **3983**
Azbel', M. Ya., quantum theory of conductivity, **762**; h.f. surface impedance, quantum oscillations of, **763**, quantum theory of, **1221**

B

Baba, K., *with others*, magnetrons for mm-λ, **4248**
Babcock, H. W., *with others*, magnetic field associated with solar flare, **4043**
Babcock, W. E., tube effects cause circuit troubles, **311**
Babits, V. A., semiconductors in vidicon-type tubes, **1703**; experimental colour television system, **2029**
Bachmann, A. E., transistor active filters, **2156**; transistor amplifier for tape and drum playback, **2175**; *Q*-multiplication with transistors, **3618**
Bachynski, M. P., microwave propagation over rough surfaces, **4184**
— *with others*, effect of mountains with smooth crests on wave propagation, **3458**
Back, F. G., zoom lenses for closed-circuit television, **1370**
Badcoe, S. R., *with others*, atmospheric discontinuity layer effects on propagation, **2000** *o*
Badessa, R. S., *R. L. Kent and J. C. Nowell*, measurement of time dilation in earth satellite, **3688**
Baer, W., *with others*, conduction of heat from anodes, **4252**
Baghdady, E. J., *and G. J. Rubissow*, dynamic trap for weak f.m. signals, **1350**
Bagl, R. R., *with H. R. Johnson*, electron beam technique for measuring circuit velocity, **3524** *o*
Bahr, O. F., *with E. Zeitler*, quantitative electron microscopy, **3444**
Bailey, D. K., abnormal ionization in ionosphere and cosmic-ray enhancements, **1562**; effect of echo on h.f. communication circuits, **3471**
Bailey, G. C., *with others*, effect of neutron irradiation on Curie temperature of ferrites, **898**
Bailey, R., *and E. C. Fellows*, stabilization of 9-kW electromagnet, **3072**
— *with others*, Canadian caesium-beam standard of frequency, **2701**
Bailey, V. A., possible effects of gyro-waves in ionosphere, **3308**
Bailin, L. L., *and R. J. Spellmire*, radiation fields from slots in circular cylinders, **1093**
Bain, W. C., angular distribution of energy received by ionospheric scatter, **2000** *h*
— *and E. D. R. Shearman*, observations on U.S.S.R. earth satellites, **2952**
Baines, J. E., *with D. H. Roberts*, photoconductivity in PbSe films, **830**
Baker, B. W., *with others*, dual-cavity microwave discriminator, **1487**
Baker, D., machine for lapping semiconductor materials, **1943**
Baker, J. M., *W. Hayes and D. A. Jones*, paramagnetic resonance of impurities in CaF_2, **3411**
— *with others*, r.f. spectra of hydrogen deuteride, **1852**
Baker, W. P., high-speed-sweep single-stroke oscilloscope, **1317**
Baker, W. R., *with others*, hydromagnetic capacitor, **1843**
Bakhru, K., *with others*, triple splitting of F echoes, **1885**
Balashek, S., *with H. Dudley*, automatic recognition of phonetic patterns in speech, **1061**
Balder, J. J., frame around television screen, **2764**
Baldinger, E., transistor applications in pulse circuits, **3228**
— *H. Bilger and M. A. Nicolet*, influence and creation of lattice defects in junction transistors, **2771**
Baldwin, J. E., *with J. R. Shakeshaft*, radio emission from 'supergalaxy', **3660**
Balkanski, M., *and R. D. Waldron*, internal photo-effect and exciton diffusion in CdS and ZnS, **824**
Balluffi, R. W., *with F. L. Vook*, irradiated Ge, length and resistivity changes in, **2306**, structure of, **2308**
Balser, M., scattering by turbulent inhomogeneities, **1335**
— *W. B. Smith and E. Warren*, reciprocity of ionospheric transmission, **1667**
Banbury, P. C., *with J. D. Nixon*, changes in excess-carrier concentrations, **1228**
Bancie-Grillot, M., *and others*, fluorescent emission lines and luminous absorption lines in CdS, **2618**
— *with others*, influence of magnetic field on fluorescence of pure CdS, **2622**
Bane, W. T., *with others*, automatic graph plotter, **2859**
Banerji, R. B., asymmetric information channels, **3103**
Banks, E., *with A. H. Mones*, cation substitutions in $BaFe_{12}O_{19}$, **540**; ferrimagnetism in system Na_2O-ZnO-Fe_2O_3, **904**
Bannerman, R. C., *J. A. Lucken and D. J. Wootton*, design of gridless low-voltage reflex klystron, **3524** *dd*
— *with others*, experimental annular reflex klystron, **3524** *bb*
Banno, N., *with others*, effect of solar eclipse on geomagnetic field, **2562**
Bappu, M. K. Vaina. See Vaina Bappu, M. K.
Baranova, Z. N., *and K. A. Velizhanina*, acoustic properties of sound-absorbing material, **686**
Baranskii, P. I., volume Peltier effect in Ge, **3776**
— *and V. E. Lashkarev*, bulk thermo-e.m.f. in Ge, **524**

Quilter, W. A. E., radio relay systems and C.C.I.F., **264**
Quinn, W. E., *and others,* r.f. spectra of hydrogen deuteride, **1852**
Quirk, J. B., u.h.f. tuner using r.f. amplifier, **1383**

R

Rabenhorst, H., *and J. Melicherčík,* dielectric properties of $BaTiO_3$, **1601**
Rabkin, L. I., *and Z. I. Novikova,* design of coils with ferrite cores for a.f., **1790**
Radelt, H., lamination-type structure of CdS crystals, **3727**
Rademakers, A., *with H. G. Bruijning,* pulse transformer with pre-magnetization, **1469**
Radford, H. E., *and V. W. Hughes,* microwave Zeeman spectrum of atomic oxygen, **4032**
Radstake, G., Netherlands broadcasting centre at Lopik-Radio, **266**
Raemer, H. R., *and A. B. Reich,* correlation devices detect weak signals, **3099**
Ragavan, D. G., slit resonators as sound absorbers, **687**
Rainville, L. P., *with others,* measurements of bandwidth of waves propagated beyond horizon, **3459**
Raisbeck, G., nonuniformities in laminated transmission lines, **2101**
Raizer, M. D., *and I. S. Shpigel',* microwave investigation of plasma, **3262**
Raja Rao, K. S., seat of L currents causing geomagnetic tides, **2247**
— *and K. R. Sivaraman,* lunar geomagnetic tides at Kodaikanal, **1534**
Rajchman, J. A., magnetics for computers, **1782**
— *G. R. Briggs and A. W. Lo,* transfluxor-controlled electroluminescent display panels, **568**
Raju, T. A., *with others,* nature and origin of atmospherics, **3699** *a*
Ralph, E. L., *with S. L. Matlow,* ohmic Al/*n*-type Si contact, **3356**
Ramamurti, T. V., *with others,* temperature-sensitive ceramic reactance element, **45**
Ramana, K. V. V., *with B. R. Rao,* diurnal variation of absorption on 5·65 Mc/s, **3699** *j*
Ramanathan, K. R., *with R. V. Bhonsle,* cosmic radio noise on 25 Mc/s, **3699** *f*
Ramdas, A. K., *with H. Y. Fan,* infrared absorption and photoconductivity in irradiated Si, **4089** *b*
Ramsa, A. P., *H. Jacobs and F. A. Brand,* microwave techniques in lifetime measurement, **3774**
Ramsey, N. F., *with others,* r.f. spectra of hydrogen deuteride, **1852**
Ranby, P. W., *with others,* activation of ZnS and (Zn,Cd)S phosphors, **3736**
Randolph, L. W., *with others,* instrumenting Explorer I satellite, **1547**
Rangan, C. S., *with others,* temperature-sensitive ceramic reactance element, **45**
Ranzi, I., back-scatter ionospheric sounding experiments, **1197**
— *and A. Porreca,* skip-distance determination by back-scatter sounding, **1340**
Rao, B. R., *and D. S. Murty,* c.w. method for study of drifts, **3699** *l*
— *and K. V. V. Ramana,* diurnal variation of absorption on 5·65 Mc/s, **3699** *j*
— *and E. B. Rao,* horizontal drifts in F_1 and F_2 regions at Waltair, **2242**; effect of enhanced solar activity on F_2 drifts, **3699** *k*
— *R. Chatterjee and S. K. Chatterjee,* dielectric aerials, **2118**
— *E. B. Rao and Y. V. R. Murty,* effect of magnetic activity on F_2 drifts, **2586**
— *with others,* magneto-ionic fading in pulsed radio waves, **944**
Rao, B. V. T., *and M. K. Rao,* ionospheric absorption over Delhi, **810**
Rao, E. B., *with B. R. Rao,* horizontal drifts in F_1 and F_2 regions at Waltair, **2242**; effect of enhanced solar activity on F_2 drifts, **3699** *k*
— *with others,* effect of magnetic activity on F_2 drifts, **2586**
Rao, M. K., *with B. V. T. Rao,* ionospheric absorption over Delhi, **810**
Rao, M. N., *and A. P. Mitra,* effect of vertical drifts on nocturnal ionization of lower ionosphere, **1878**
— *with others,* hourly median field strength of 1040-Mc/s signal, **255**
Rao, M. S., irregularities in E region, **4054**
— *and R. L. Armstrong,* radio reflections along a meteor train, **2226**
— *with others* magneto-ionic fading in pulsed radio waves, **944**
Rao, M. V. S. S. K., *with N. K. D. Choudhury,* panel absorbents for low-frequency sound, **2821**
Rao, N. N., *with Y. V. Somayajulu,* galactic radiation at 30 Mc/s, **3699** *i*
Rao, P. R., analysis of circuit transients using Laplacian transformation, **728**
Rao, P. V. S., character display system for digital computer output, **3968**
Rao, R. A., *with A. Singh,* ferrite-tuned magnetron, **3163**
Rao, T. S., *with others,* abnormal ionospheric behaviour at 10 mλ, **808**
— *with others,* emission from sun at 30 Mc/s, **3699** *o*
Rapaport, H., ferrite frequency separator, **2466**
Rappaport, P., *with J. J. Loferski,* effect of radiation on Si solar-energy converters, **1366**; electron-bombardment-induced recombination centres in Ge, **4108**
Rappaport, W., pitch distribution in German language, **2088**
Rasmussen, A. L., *with R. D. Harrington,* permeability spectra of Y-Fe garnet, **1291**
Rassadin, B., single-sideband modulation, **587**
Rastogi, R. G., geomagnetic influence of F_1 and F_2 regions, **2245**; diurnal development of equatorial F_2, **3707**
Ratcliffe, J. A., information by radio from satellites, **1869**
Rath, H. L., properties of Si rectifiers for communications, **2022**
Rausch, R. H., *and T. T. True,* reference generator for colour TV receivers, **1324**
von Rautenfeld, F., evaluation of field-strength measurements, **3419**
— *with E. Belger,* interference protection ratios for sound broadcasting, **3464**
Ravi Varma, A. R., *and H. D. Krishna Prasad,* effect of restricted frequency characteristics on intelligibility of speech, **2755**
Rawer, K., The Ionosphere, **(B)1200**; problems in ionospheric forecasting, **1333** *i*
— *and K. Suchy,* 'fourth reflection condition' of e.m. waves in plasma, **1164**; equivalent theorems of wave absorption in plasma, **1669**; dispersion formula of Lorentz plasma, **3641**
— *with E. Harnischmacher,* drift observations evaluated by method of 'similar fades', **801**
— *with others,* ionospheric observations during solar eclipse of 30th June 1954, **131**; rocket measurements of absorption in lower ionosphere, **2972**; variation of ionospheric absorption, **3716**
Rayner, G. H., calibration of inductors, **2346**
Razbirin(e), B. S., *with E. F. Gross,* effect of deformations on spectrum of CdS, **3730**
— *with others,* line spectra of absorption edge of CdS, **471**; fluorescent emission lines and luminous absorption lines in CdS, **2618**
Reber, G., radio interferometry at 3 km above Pacific Ocean, **2219**; suppressed-sidelobe antenna, **3575**
Reddish, A., *with others,* frequency pushing in crossed-field oscillators, **2788** *q*
Reddy, C. A., *B. R. Rao and M. S. Rao,* magneto-ionic fading in pulsed radio waves, **944**
Reder, F. H., frequency shift in sealed atomic-beam frequency standards, **4148**
— *with others,* comparison of Cs frequency standards, **212**
Rediker, R. H., *with J. Halpern,* mμs switching diodes, **3144**
— *with A. L. McWhorter,* cryosar, **3211**
Redlich, H., *and H. J. Klemp,* electromechanical transducer for stereophonic recording, **2096**
Redstone, R., *with others,* coaxial-line diode, **3524** *m*
Redwood, M., *with others,* absorption of compressional waves in solids, **3536**
Reed, B., *O. A. Weinreich and H. F. Mataré,* conductivity of grain boundaries in Ge bicrystals, **2657**
— *with others,* grain-boundary amplifier, **3241**
Reed, E. D., *with others,* helix travelling-wave amplifier, **2788** *a*
Reed, J., multiple-branch waveguide coupler, **3559**
Reed, W. O., *and W. F. Niklas,* shutter image converter tube for multiple-frame photography, **2369**
Rees, J. R., *with A. E. Barrington,* 3-cm *Q*-meter, **562**
Rees, M. H., *and G. C. Reid,* aurora, radiation belt and solar wind, **4063**
— *with E. K. Proctor,* scanning lens design for minimum phase error, **1101**
Reeves, R. J. D., recording and collocation of waveforms, **1650, 2357**
Rehkopf, C. H., gas evolution or sorption of anode materials, **2985**
Reich, A. B., *with H. R. Raemer,* correlation devices detect weak signals, **3099**
Reich, H. A., *with others,* transistorized crystal-controlled marginal oscillator, **1805**
Reichel, R., *with others,* resolving power of scintillation multipliers, **3081**
Reichl, R., audibility of nonlinear distortion, **3185**
Reid, G. C., electric-field theory of aurorae, **1887**
— *and C. Collins,* abnormal v.h.f. absorption, **2380**
— *with H. Leinbach,* upper-atmosphere ionization by particles from solar flare, **1521**
— *with R. Parthasarathy,* signal-strength recordings of satellite 1958 δ2, **1193**
— *with M. H. Rees,* aurora, radiation belt and solar wind, **4063**
Reimer, L., investigations of thermal transformation of cathode-sputtered Ni films, **895**; Hall-effect measurements in Ni films, **1280**

Zyazev, V. L., *and O. A. Esin*, influence of short-range order on type of conductivity, **3750**

Zyryanov, P. S., *and G. G. Taluts*, acoustic-electrical phenomena in degenerate plasma, **3638**

SUBJECT INDEX

A

Absorption, (See also Resonance; Wave Propagation)
  acoustic, calculation of statistical coefficient from impedance-tube measurements, 3920
    of fibrous materials, coefficients for, 3549
    of hollow cylinders, 3547
    in lined ducts, 683
    low-frequency, slit-resonators for, 687
    reciprocity violation in, 332
    resonant plywood panels for, 2821
    in reverberant field, calculation of coefficient from impedance value, 3921
    in sea, reverberation tank for measurements, 1043
    of sound-insulation materials, 686
    in transition layer between homogeneous media, 669
    waveform distortion effects in, 668
  of e.m. waves, by resonant slots, 2205
    structures for, 1068
  microwave, in artificially anisotropic media, 1847
    by grid of lossy dipoles, 1846
    in NH_3 at 6 mm λ, 2213
    polarization and angle dependence of reflection of absorbers, 2915
    Zeeman spectrum of atomic oxygen, 4032
  ultrasonic, in metals, 3336
      collision drag effect, 2444
    in quartz, at 1–4 kMc/s, 2636
    in seawater, at 50–500 kc/s, 2082
    in solids, at 100–1000 Mc/s, 3536
    in viscous liquids, 671
Acoustics, (See also Absorption; Diffraction; Sound; Ultrasonics)
  architectural, automatic evaluation of sound reflections, 3545
    design of Alberta auditoria, 688
    design of talks studios, 2822
    distribution of normal modes in rooms, 684
    'echo parameter' criterion in, testing of, 685
    effect of room shape on sound field, 3916
    features of auditoria and concert halls, 1063
    iteration method applied to speech and music, 1428
    reverberation-curve characteristics, 3546
    sound pressure fluctuations when receiver position is varied, 3915
    studio design for exclusion of traffic noise in Karlsruhe, 1756
    wall design for high transmission loss, 3917
  artificial ear for insert earphones, 3
  diffusion measurements, in reverberation chambers, 3919
    using rotating microphone, 3918
  insulation measurements, influence of resonances on, 2090
  measurement of impedance of closed air spaces, 3180
  research in China, 2808
  reverberation plates with electrodynamic excitation, 1755
  spectrograms of experimental music, 1425
  stereo-reverberation effect in, loudspeaker system for, 1065
Acousto-electric effect, experiments on Cu and Al, 4009
  in metals and semiconductors, 2189
Aerials, (See also Lenses, microwave)
  aircraft, automatic switching circuit for, 3568
  aperture- and horn-type, effect of flanges on radiation patterns of, 3582
  aperture-type, using helix waveguide, optimum dimensions for, 3958
    using open waveguide, radiation characteristics of, 3959
    using trough waveguide, 3960
  arrays, broadside, directivity of, 3955
    dipole, directivity factors, method of plotting, 2470
      horizontal radiation patterns around support mast, 343
    directivity control by servo system, 1092
    directivity improvement for pulsed signals, 3574
    multiplicative, for reception, 3953
    rhombic, design of, 3576
    with rotating radiation field, 2120
    scanned electrically, effective aperture of, 2847
    sidelobe suppression for m.f., 3575
    slot, for missiles and aircraft, 1774
    slotted, nonresonant, 3202
    strip, signal/noise performance, 2
    superdirective, signal/noise performance, 329
      slotted, 3572
  beam-swinging, for transhorizon propagation measurements, 3198
  cone-type, surface current distribution for required radiation pattern, 2841
  cylindrical, back-scattering cross-section of, 1444
    current distribution and input impedance of, 1085
    first-order solution by generalized circuit, 23
    theory of, 3945
  dielectric, control of radiation from, 1095
    verification of theory using perspex rod, 2118
    wax models for design of, 3204
  diplexers, resonant-ring, for forward-scatter systems, 3196
  dipole, circuit theory based on variational method, 1090
    conductance of, 1089
    conical, characteristic-impedance calculations, 2843
    electric and magnetic field of, 17
Aerials, dipole, folded, bandwidth of, 2842
    radiation over surface of given impedance, 3950
    transient ground wave radiated from, 239
    Yagi concentric feed for, 344
  directive, aperture field distribution for high-gain beam, 3952
    u.h.f., performance in complex fields, 2845
  for earth satellites, spherical-array problems, 1091
  efficiency calculations, 3944
  ferromagnetic, for sea-rescue transmitter, 4223
  helical, elliptic, radiation field of, 3577
    theory of, 3570
  hemi-isotropic, using dielectric element in waveguide aperture, 2850
  horn-type, beam-width reduction by plexiglass plates, 3961
    with parabolic reflectors, for radio links, 1777
  linear, asymmetrically fed, radiation diagram of, 3567
    driving point and input admittance of, 1440
  loop, elliptic, radiation field of, 20
      radiation resistance of, 1776
    radiation in conducting medium, 3957
    rectangular, as dipole, 3579
  mast-type, lightning-current distribution in earthing system for, 1451
  microwave, combining network for 4, 6 and 11 kMc/s, 3954
    Fraunhofer radiation pattern of, simulation in Fresnel zone of, 1096
    radiation from ring-source excited cone, 3965
    sawtooth, 3578
    scanning, Foster-type, 2121
    split reflector for reducing mismatch, 712
    with wire-grid reflector, transmission-loss data, 3963, 3964
  modulation of parameters for multipattern operation, etc., 2840
  monopole, top-loaded, earth currents near, 3947, 3948
  paraboloid, omnidirectional, vertically polarized, 1447
  as passive relay system, using Hertzian mirror, 2852
    for television, 2851
  pillbox-type, with wide-angle scanning, 1448
  with plane reflector, radiation patterns as function of spacing, 1097
  prolate-spheroid, current distribution and impedance of, 1445
  'radiansphere' around, 3566
  radiation fields of, Fresnel approximation for, Sommerfeld expansion in, 1442
  for radio-astronomy, high-resolution 2-element interferometer, 2936
    'optimum' design, 2471
    16-element array for 9300 Mc/s, 3659
    using 360-ft parabola and plane reflector, 3962
  receiving, influence of top-end capacitance on inductive coupling of, 2383
    long-wire, delta-type, 3199
  reflector-type, attenuation in radio links of, 1778
    corner, with arbitrary dipole orientation and apex angle, 1099
      circularly polarized, 1098
      gain of, 3205
    log-periodic, for 105–430 Mc/s, 2853
    parabolic, with feed displaced from focus, 2474
  rhombic, with cylindrical helices as arms, 19
    design methods, 3956
  scanning system, using ferrite-loaded aperture, 2472, 2473
  short, bandwidth and efficiency of, 3946
  slot, annular, design data, 2849
    conical radiation field of, 3580
    in filled and unfilled waveguide, radiation from, 21, 22
    in parallel-plate transmission line, 3203
    voltage breakdown characteristics, 3581
  slotted-cylinder, for four simultaneous transmissions, 1443
    radiation patterns of, 1093
  slotted-waveguide, for marine radar, 711
  on smooth curved surface, radiation pattern of, 3195
  spiral, equiangular, 3949
  strip-type, current distribution with normally incident plane wave, 1086
  for submarines, design of, 2469
  surface-wave, corrugated and dielectric-clad, for beacon applications, 1449
    scanning-type, using corrugated conductor, 3201
  s.w., for ionospheric sounding, 710
    microwave model for studying directivity characteristics, 709
  switches, phase-shift type, for radio-astronomy interferometer, 2844
  television, receiving, adaptation problems, 1775
      frame-type, 3200
      wide-band, for band III, 2122
    transmitting, quadruplexer for, 2119
      slotted-cylinder, for v.h.f., 1094
      Süddeutscher Rundfunk, 1773
      u.h.f., post-installation tests of, 1088
      in U.K., 3571
  transmitting, automatic tuning systems, 3197
    performance data for, 1087
    for simultaneous transmission of broadcast programs, 16
  travelling-wave, design method for, 3569
    for determination of end-fire echo area of long thin bodies, 1446
  U.R.S.I. report on, 3565
  v.h.f., 3-band combining network for, 733
Aerials, v.l.f., using power transmission line, 1672
  zig-zag, radiation characteristics of, 2848
Alloys, Mn-Cu and Co-Cu, dilute, low-temperature electrical and magnetic properties of, 2673
  of transition metals, electron structure of, 418
Amplification, parametric, circuit conditions for, 75, (C)2897
    and frequency mixing in propagating circuits, 76
    of space-charge waves, 1025
  wide-band, at h.f. using artificial transmission lines, 3234
    techniques for, 1490
Amplifiers, (See also Circuits; Valves)
  a.f., using auxiliary ultrasonic signal, 2514
    class-B, distortion reduction in, 2883
      performance with random noise signals, 2168
    ultralinear, using cathode followers in place of tapped transformer, 1493
    3-valve, 63
  band-pass, design formulae for, 2512
  cathode-follower, design data, 3235
    maximum amplitude as function of output time-constant, 751
  class-C, response of, 1138
  d.c., compensation for changes in heater supply voltage, 750
    for control systems, 748
    using magnetic modulators, 2165
    for measurements, zero adjustment of, 2342
    using semiconductors, 3233
    transient response of, 3994
    with transistor chopper, 2519
    with whole-loop feedback, 1137
  d c. and chopper-type, using transistors, 1498
  differential, for reducing effects of power-supply variations, 3615
  distributed, using straight-wire transmission line, 1492
    v.h.f., for coupling receivers to aerial, 749
    wide-band, for short pulses, 747
    for 200-Mc/s pulses, 2166
  feedback, matrix analysis of equivalent quadripoles, 2497
  h.f., low-noise, using disk-seal triode, 3236
  input circuits for, low-capacitance, 752
  linear, for negative pulses, 62
  logarithmic, voltage-operated, 3996
    wide-band, 50 c/s–100 kc/s, 2169
  lumistor, using coupled electroluminescent cell and photocell, 3884
  magnetic, a.c.-controlled, 382
    analysis of, 3237
    applications of, 2516
    with combined magnetic and electrical feedback, 3998
    design for maximum power, 381
    with dynistor and trinistor semiconductor switching devices, 2174
    fast-response, transfer efficiency of, 3238
    feedback in, 2172
    half-wave, theory of, 1495
    operating characteristic of, graphical determination of, 3617
    for servo systems, 2173
    shunt-coupled, using gate voltage as output, 3997
    'variable-μ', 2170
    volt-second transfer efficiency in, 2171
  maser, Bloembergen-type, materials for, 3242
    dual system with lossless power-dividing network, 388
    based on hyperfine levels of Cu ions, 2181
    for infrared and optical wavelengths, 1857
    method for tuning cavity, 74
    molecular-beam, sub-mm-λ, 1146
    multiple-level, pulsed-field, 3623
    NH_3-beam, as frequency standard, 389
    noise-figure measurement, 2343
    paramagnetic, theory of, 2894
      3-kMc/s, using $Al_2O_3.Cr_2O_3$ crystal, 1145
    principles of, 1500
    pulsed, analysis of emission conditions, 756
    ruby, 2178
      L-band, tunable, 2523
      low-field, 3624
      wide-band, tunable, 1144
      3-level, 1143, calculation of resonance conditions in, 3622
    ruby as material for, 3793
    small-signal analysis of, 1501
    solid-state, travelling-wave, 2891, 3-level, 2177
      2-level, behaviour of, 73, materials for, 3037
      3-level, 1502
      300–500-Mc/s, 4002
    'staircase'-type, proposal for, 2522
    weak-field, for nuclear-magnetic-resonance investigations, 2548
      self-oscillator, 2521
    X-band, for radio astronomy, 2892
    zero-field, 2889
    2-level, radiation damping effects in, 1818
    3-level, double-quantum process for, 2890
      as heat engine, 2212
  maser action at 1 500 Mc/s by 3-level excitation, 3654
  masers and quantum-mechanical devices, theory of, 72
  microwave, using negative-conductance 'tunnel' diode, 3246
    negative-mass, using semiconductors, principles of, 1824
    solid-state, 4004
  molecular-beam and paramagnetic-crystal types, 2888
  nonlinear, effect of reaction on gain of, 2167
Amplifiers, operational, without stabilized supply, 1494
  parametric, 2896
    cancellation of ferromagnetic hysteresis by orthogonal polarization, 3244
    cavity-type, with variable coupling, 2185
    electron-beam, 321
      cavity-type, 2066
      design of travelling-wave couplers for, 2067
      pumping of fast space-charge wave for, 1412
      with transverse modulation, 4247
      3-frequency, analysis for, 2065
    ferromagnetic, pulsed, gain measurements on, 2184
    using grain boundary in Ge, 3241
    as limiter without phase distortion, 1819
    'mavar' operation, 79
    nonlinear-capacitance, 1820
    performance of, 77
    for reception of space signals, 2895
    using Si-diode, for 900-Mc/s scatter link, 390
    solid-state, low-noise, 1503
    superregenerative, 3243
    as superregenerative detectors, 3245
    surface-wave, ferroelectric, 3625
    travelling-wave, analysis of, 3240
      4·5-Mc/s, 2524
    using variable-reactance diodes, with directional bridge system, 2183
      as phase-distortionless limiter, 2182
      relaxation phenomena in, 3626
    X-band, using GaAs diodes, 4006
    4-terminal, using Ge diodes, 1148, analysis of, 4005
    2900-Mc/s, 'reactatron', using junction diodes, 1150
    4-kMc/s, using Ge diodes, 1149
  power, grounded-grid, using disk-seal valve, design data for, 2884
  pulse, based on impact ionization in Ge, 2882
    with sub-mμs rise time, 1135
    0·1-μs, using auxiliary boost circuit, 3993
  r.f., unsymmetric, sideband currents with a.m. in, 3992
    60-kW, 6–27-Mc/s, 290
  semiconductor, avalanche-controlled, theory of, 3620
  transistor, a.f., 67
      for acoustic measurements, 1499
      preamplifier for magnetic-tape playback, 387
      push-pull, single-ended, 2885, 2887
      RC-coupled, design of, 1816
      4·5-W, sliding-bias, 384
      25-W, 2886
    bias-network design using thermal parameters, 1140
    class-A, common-emitter, nonlinearity of, 1817
    common-base and common-emitter, gain stability and frequency response of, 1139
    d.c., design considerations for, 65
      differential circuit for reducing drift in, 1496
      for servo system, 2176
    feedback, design of, 3239, equations for, 3619
    i.f., emitter-current-controlled, 2517
    l.f. design procedure, 3999
      low-noise input stages for, 4001
    low-noise stages with negative feedback, 1142
    for magnetic tape and drum playback, 2175
    matrix method of circuit analysis for, 1141
    narrow-band, nomographs for, 1497
    negative-resistance, for *Q*-multiplication, 3618
    pulse, 2518
      with nonlinear feedback, 386
    stability of, 4000
    tetrode, for 30-Mc/s i.f. stages, 70
    thermal stabilization using half-supply-voltage principle, 71, 755
    video-frequency, design of, 385
      stagger-tuned, 754
      with 80-V output, 69
    2-stage, high-gain circuit, 66
    15-W, for public-address system, 68
  tuned-transformer-coupled, design charts for, 2513
  u.h.f., power-type, using travelling-wave valves, 380
  video-frequency, with cathode compensation, 1814, 2515
    using valve Type PCL84 with anode compensation, 379
  wide-band, design data for, 1491
    for investigation of electron avalanches, 1136
    400–450-Mc/s, for radar and scatter, 64
Analysers, amplitude, with variable-width output pulse, 1976
  frequency, wide-range, using 2 reference signals, 2712
  pulse-height, using beam-deflection valve, 3990
    multichannel, using distributed circuits, 377
    single-channel, 59
    10-Mc/s, 2505
  spectrum, for testing quartz crystals for spurious response, 1642
  time-interval, encoder for, 2339
    vernier chronotron, 2338
      for nuclear particles, 1965
  waveform, for frequency characteristics of filters, 1969
    for sorting of circuit components, 1645
    for spectrum of random-noise generator, 1309
    uniform transient error in power-level measurements by, 216
Antiferromagnetic materials, Curie-point phenomena in, 3391
  nonmagnetic ions in, 189
  rock-salt-type, multispin axis structures in, 188
Antiferromagnetism, in $Cu_3(CO_3)_2(OH)_2$, 1947
  of $Cu_2Fe.2H_2O$, 1946
Astrophysics, highly ionized regions in interstellar medium, 3272
  interplanetary magnetic field and effect on cosmic-ray variations, 783
  theorem on force-free magnetic fields, 784
Atmosphere, (See also Ionosphere; Troposphere)
  electrical properties of, radiosonde measurements of, 1195
  lower, thermal structure of, 136
  upper, in auroral zone, 3704
    composition of, 1551
    density variations due to hydromagnetic heating, 4057
    geophysical effects of high-altitude explosions, 2575
    investigation of ionization by rockets and satellites, 3702
    night airglow in, phenomenological description of, 1567
    pressure measurements at 50–100 km, 3701
    rocket-borne ion-spectrometer measurements, 3703
    rocket investigations of composition of, 3700
    temperature distribution in, 1876
    temperature of regions of nightglow, 1877
    turbulence measurements at 80–100 km, 4058
    wind determination using artificially generated Na cloud, 3302
    100–800 km, model based on rocket and satellite data, 3300
Atmospheric electricity, charge distribution in clouds, 456
  thunderstorms, electrification and precipitation in, 2253
Atmospherics, average power of impulsive noise, 1354
  effect of atomic explosions on, 4067
  l.f., simultaneous recordings on 4 frequencies, 813
  noise measurements at h.f. in India, 2743
  polarization by successive reflections from ionosphere, 143
  recording of, integrating circuit for, 2870
  related to lightning discharges, 814
  with superimposed pulses, recording of waveforms of, 815
  v.l.f., emissions from exosphere, 1575, 3311
    propagation-mode measurements, 3094
    spectra of, 3313
    theory of travelling-wave amplification for, 4066
  waveform of lightning impulses producing whistlers, 142
  waveforms of, classification and interpretation of, 459, 3312
  'whistler-mode' echoes remote from conjugate point, 2731
  whistlers, 1576
    correlation with lightning flashes, 458
    cyclonic disturbances as cause of, 3719
    dispersion and solar activity, 144
    path combinations for observed echo groups, 1577
    propagation in regions of low electron density, 1578
  27-kc/s, sudden enhancement of, solar-flare anomaly in, 1579
  at 27 and 100 kc/s, observations at Delhi, 1580
Attenuators, coaxial, alignment aid, 3927
  microwave, calibration by absolute bridge method, 1123
Aurora, and airglow, photoelectric measurements of H_2 emissions in, 3310
  artificial, due to nuclear explosion, 1569, 1888
  australis, radar echoes at 69 Mc/s, 141
  australis and borealis, comparison of radar echoes from, 140
  displacement of radiant point during disturbance, 138
  disturbances, scattering of radio waves during, 2001
  drift effects related to radiation belt and solar wind, 4063
  electric-field theory of, 1887
  equal-frequency lines (isochasms), theoretical and observed, 2975, (D)4062
  formation of, 1568
  intense, l.f. reflections from 75–90 km during, 812
  ionization geometry from v.h.f. echo data, 137
  ionization and magnetic disturbances, 1570
  at low latitudes, spectroscopic observations, 2592
  phenomena during storm, 3309

  radar echoes from, horizontal motion observed at Saskatoon, **2255**
    movement related to magnetic-disturbance current system, **2593**
    polarization of, **4064**
    u.h.f. observations of, **1573**
    at 400 Mc/s, **4065**
  radiation at 500 Mc/s, **139**
  radio reflections from, angle-of-arrival measurements at Kjeller, **2254**
    geometry of, **1671**
    on ionograms obtained in minauroral region, **457**
    at low latitudes, **1670**
  subvisual, and simultaneous occurrence of noise bursts on 4·6 kc/s, **2974**
  v.h.f. radar for research on, **1574**

B

Barretters, low-voltage, theory for, **270**
Batteries, (See also Power supplies)
  dry, using C-nitroso compounds, **2402**
    internal resistance, pulse measurement of, **2760**
  lead-acid, self-discharge reactions in, **2403**
Book notices and reviews, The Advanced Theory of Statistics, Vol. 1: Distribution Theory, **1639**
  Advances in Electronics and Electron Physics, Vol. 9, **327**
  Atmospheric Electricity, **1201**
  Handbuch der Physik, Vol. 16, **3657**
  The Ionosphere, **1200**
  Light Scattering by Small Particles, **1519**
  Radio Research, 1957, **2077**
  Russian-English Electronics and Physics Glossary, **660**
  Scientific Uses of Earth Satellites, **2595**
  Semiconductor Thermoelements and Thermoelectric Cooling, **207**
  Transistor Circuit Engineering, **757**
Breakdown, of air at high altitudes, for frequency range 100 Mc/s–35 kMc/s, **1834**
  of air and other gases at 9·6 Mc/s, **395**
  in solid dielectrics, electron bombardment as cause of, **2336**
Bridges, a.c., for measurement of p-n junction characteristics, **1648**
  capacitance, balanced unsymmetrical parallel-T network as, **3062**
  coaxial displacement dielectric cell for liquids, **3063**
  double-T, for dielectric constant of ferrites, **4158**
  microwave, with ferrite isolator for paramagnetic resonance detection, **1982**
  Mueller, use of d.c. amplifier and recorder for balancing, **3061**
  Wheatstone, screened, for precision measurement of resistance, **561**
Broadcasting, a.m., interference protection ratios for, **3464**
  measurement of program level, **3187**
  shared-channel, subjective tests of interference in, **3479**
  sound and television, progress review, **2749**
  stereophonic, systems for, **2397**
  studios, Karlsruhe, equipment of, **2016**
    Südwestfunk, design of, **3182, 3183**
      equipment of, **3188**
  s.w., in Netherlands, 30-year survey, **265**
    Netherlands World Centre at Lopik-Radio, **266**

C

Cables, coaxial, eccentric, inductance of, **3191**
    response calculations for transient waveform in, **3925**
    solderless technique for splicing and earthing, **336**
    solid-dielectric, attenuation above 3 kMc/s, **337**
    supporting-disk data, **3926**
    test results under extreme conditions, **2457**
    theory, construction and testing, **335**
Capacitance, bridge measurements of, errors due to leads in, **1316**
  measurement for two infinite cones, **3820**
  standards, laboratory determination of absolute unit, **2699**
Capacitors, Al and Ta, dielectric films in, **725**
  ceramic, temperature-sensitive, using CeO, **45**
  electrolytic, Al, methods of increasing electrode surface area, **2868**
    solid-state, advances in, **1111**
    Ta, increase of capacitance by etching, **359**
      solid-electrolyte, **2137**
  ferrite-cored, **726**
  ferroelectric, for f.m. of v.f.o., **3247**
    as tuning elements, **1472**
  hydromagnetic, **1843**
  impedance of, as function of frequency, **2136**
  paper, d.c. breakdown of, **1473**
    impregnants for, comparison of wool wax and petroleum jelly, **1474**
    probable life of, **3219**
  parallel-plate, subarea method for calculating capacitance of, **1794**
  printed, Ta, **2867**
  pulse-loaded, dielectric losses in, **2493**
  standard, cylindrical, sectioned, **3051**
  variable, giving linear frequency variation, **3973**
  voltage-variable, selection guide, **3599**
    Si-junction, **46, 3974**
Cathode-ray oscillographs, with accelerating voltage in form of long-tailed pulse, **1317**
  amplitude/frequency display using ratio method, **219**
  camera for automatic recording from, **1978**
  for character writing, using combination of l.f. waveforms, **467**
  image distortion by RC networks in, **1318**
  for phase characteristics of transmission systems in range 0·1–10 Mc/s, **1310**
  pre-pulse techniques for extending range of, **3827**
  pulse system for high-accuracy V/I characteristics, **4160**
  sample method for displaying mμs pulses, **3828**
  survey of types available in U.K., **1977**
  with travelling-wave deflection system and large field of view, **927**
Cathode-ray tubes, (See also under Television)
  automatic electrical welding of, **2799**
  energy losses at binder films of phosphor screens in, **3173**
  low-voltage, development of, **2713**
  magnetic-deflection, errors in and coil design for, **3125**
  'peritron', with moving screen for 3-dimensional display, **1747**
  phosphors for low-scanning-speed displays, **4254**
  screens for, aluminized, surface phenomena associated with organic barrier film in, **2438**
    effect of temperature on persistence of, **2440**
  storage-type, for direct viewing, survey of, **1744**
    half-tone, survey of, **1745**
    iatron, **1746**
  thin, rectangular, **3171**
  for 'writing' directly on current-sensitive paper, **1748**

Cathodes, (See also Electron emission; Photocathodes)
  activated, Ni-base, research on, **2069**
  breakdown of coatings on, **1029**
  carbonization techniques for high-power magnetrons, **3530**
  Cs-Sb, energy distribution of electrons from, **2070**
  development of, **2068**
  discharge modes with, **2441**
  dispenser-type, pressed and impregnated, **2791**
  for high current densities, **3893**
  impregnated with Ba-Ca aluminate, evaporation of Ba from, **2792**
  Ni-matrix, processing technique for, **4250**
  oxide, conduction mechanism of, **1026**
    conductivity in magnetic field, **2428**
    Hall effect in, **3166**
Cathodes, oxide, noise in, **1027**
    preconversion technique for, **3891**
    processing of, servo system for, **651**
    reversible poisoning of, **4249**
    SrO, dissociation by electron impact, **3892**
  oxide-cored, for electron microscopy, **3078**
  point-type, for electron microscopes, **3077**
Cells, (See also Batteries; Photocells)
  dry, Mg-BiO, **3865**
    Zn/Hg-dioxysulphate type, **3866**
Circuits, (See also Networks)
  amplitude-comparison, **3600**
  cathode-follower, for d.c. reference level, **2164**
  clamping or d.c. restoration, **2138**
  construction using thin-film components, **354**
  counter, coincidence, using transistors and diodes, **3230**
    decade, 1-Mc/s, using transistors, **1131**
    dekatron, for addition and subtraction, **1110, 1812**
    multiphase-output, from d.c. to 500 kc/s, **58**
    ring-type **2506, 2507**
    transistor, **3231**
  coupled, double-tuned, response of, **1815**
    stagger-tuned and synchronously tuned, correlation between, **364**
    wide-band, design data for, **3995**
  differentiating, **1795**
  diode and triode, with short time-constant, **3221**
  ferroresonant, **2140**
    with square-loop reactor, **2141**
  gating, neon-bulb, for digital computers, **358**
    phase-selective, rejecting quadrature component, **719**
  integrating, compensation for waveform distortion due to valve capacitances, **1479**
    feedback, l.f. noise reduction in, **369**
    long-time-constant, pulse response of, **2870**
  limiter, **2494**
    cathode-coupled, characteristics of, **1813**
  microcircuits with distributed resistance and capacitance, **3972**
  microminiaturization, micromodule system, **2485, 2486**
    program at D.O.F.L., **2484**
  microwave, using low-noise devices, **3971**
    theory and techniques of, **3175**
  miniaturization of, using integrated semiconductor devices, **3213**
  modular, integrated micromodules, **2863**
  potted and printed, **2862**
  printed, electroless copper plating for, **3047**
    foil-clad laminates for, **355**
    manufacture and assembly of, **1788**
    for microwave links, **2488**
    test patterns for, **2487**
    through-connections for, **38**
  pulse, using cold-cathode valves, **374**
    time/height converter, **2879**
    transistor, **3228, 3229**
      avalanche-type, **2878**
    20-mμs linear gate, **2880**
  pulse-forming, for radar, **375, 742**
  regenerative, using 'hybrid' valve-transistor arrangements, **2877**
  sequential, using transistors, **3613**
  switching, coincidence-diode, for radar displays, **1792**
    using crystal diodes, **2866**
    using electroluminescent cells and photoconductors, **1108**
    ferroelectric, 'transpolarizer' with stored setting, **1104**
    using gas-filled diode, **724**
    using magnetic cores, **2492**
      performance of, **3217**
    phototransistor, temperature-stabilized, **1109**
    representation by binary-decision programs, **3215**
    ring-type, for high-speed multiplexing, **3218**
    using saturable transformers, **1471**
    using semiconductors, current build-up in, **889**
      microwave, **3597**
    ternary, **1789**
    transistor, **43**
      delayed switch-off effect in, **722**
      for missile count-down, **3598**
      parameters of various types, **723**
    with voltage-controlled delay, **2865**
  transistor, nodal construction method for, **1796**
  trigger, bistable, using unijunction transistors, **744**
    increased sensitivity using crystal diode in feedback loop, **57**
    with series valve connection, **2163**
Coils, ferrite-cored, for a.f., **1790**
  inductance, calibration at power and audio frequencies, **2346**
Colour, vision, characteristics and two-coordinate system for, **3629**
Committees, C.C.I.R. and U.R.S.I., work of, **1036**
Communication circuits, h.f., effect of echo on operation of, **3471**
    maritime, signal strength measurements at Cadiz, **3859**
    'minimum-loss operation time' for, **258, 1359**
    U.K.–Commonwealth, performance index for, **261**
Communication systems, (See also Phototelegraphy; Radio links)
  a.m., long-distance, addition of distortion voltages in, **3856**
  binary channels in cascade, **2388**
  binary-code, decision feedback systems, **591**
    decoding techniques in, **2747**
    error probability in, **2389**
    feedback, **2387**
    keying systems, error probability in, **2746**
  in Brazil, **3176**
  in buildings, field-strength measurements at v.h.f., **1688**
  compandor for speech transmission, **2395**
Communication systems, for data transmission over telephone lines, **1684**
    f.m. digital subset for, **2392**
  using earth satellites, **964, 2012**
  'Frena' and 'Frenac', nonlinear system for transmissions at high noise levels, **2753**
  in Ghana, **961**
  l.f., design of, **2750**
  line, transistor applications in, **594**
  meteor-burst-type, choice of frequencies for, **597**
    JANET, **4198**
  microwave, network for Pacific coast, **2398**
    tropospheric-scatter, using angle diversity, **2751**
  mobile, with 920 channels between 30 and 76 Mc/s, **262**
  multichannel, using angular modulation, r.f. powers and noise levels in, **598**
    carrier telephony on power lines, **2748**
    f.m., measurement of degree of intermodulation due to mismatch, **2396**
    frequency-diversity, two-tone, **2011**
      11-kMc/s, TJ, **3106**
    p.c.m., digital, regenerative statistics of, **957**
      timing of regenerative repeaters for, **967, 968, 969**
    for telephone service, 6-kMc/s, **2393**
  multichannel relays, C.C.I.T.T. recommendations and white noise, **4199**
  multiplex, f.m., Canadian TD-2 transcontinental microwave network, **973**
      echo distortion in, **3472**
      for studio–transmitter links, **3107**
    h.f. error-correcting system for REM, **3104**
    review of, **1686**
  paging systems, design of, **3478**
    receiver and modulation equipment, **3476**
    selective, at Allentown-Bethlehem, Pa, **3477**
      f.m., microminiature decoder for, **2018**
  performance in presence of thermal and atmospheric noise, **963**
  planning of, evaluation method for comparison of radio and cable systems in, **1355**
  pulse, frequency-shift method for, **3470**
  'Rake', for multipath channels, using correlation technique, **(D)596**
  R/T, carrier-frequency-shift signalling for, **4200**
    intelligibility of speech with restricted frequency characteristics, **2755**
    multichannel, high-frequency bridging, branching and interconnecting of, **1362**
  SAGE data signalling method, **259**
  in space, infrared receiver for space vehicles, **4197**
    minimum transmitter weight for, **3141**
    problems of, **3469**
    telemetry system analysis, **3860**
  s.s.b., compatible, **971**
    'third method' for, **970**
  s.s.b. and d.s.b., suppressed-carrier, for aeronautical services, **2752**
  s.s.b. and independent-sideband, for ground/air communication, **263**
  stereophonic, compatible, using a.m./f.m. multiplex, **3105**
      using f.m. multiplex, **1363**
      using precedence effect, **3474**
    f.m. multiplex, adapter for, **2754**
      interference in, **3857**
  telegraphy, class-A1, bandwidth determination for, **962**
    code speed comparison, **593**
    error-correcting 'autoplex' system for, **966**
    l.f. and v.l.f., frequency-shift keying for, **965**
    p.c.m., phase correcting systems for, **599**
    teleprinting, coder and decoder for, **1685**
      over long-distance radio links, **960**
  telephony, carrier-current, bridge negative-feedback amplifiers for, **974**
  tropospheric-scatter, description of Canadian equipment, **975**
    design of, **1360**
    evaluation of, **595**
    multichannel, f.m., system parameters for, **1361**
    quadruple-diversity method, **972**
    tests, Start Point–Chelmsford, **260**
  in U.S. army, **2744**
  v.h.f., for port and harbour control, **3480**
  vocoder, time-division, **2394**
  waveguide transmission with h.f. carrier, pulse distortion in, **3473**
Communication theory, application to amplitude compression, **3466**
  capacity of asymmetric information channels, **3103**
  channels with side information at transmitter, **592**
  coding law, **4195**
  coding systems, binary, burst-correcting, **3468**
      variable-length, **3467**
    binary and Gaussian, merits and methods of detection of, **2010**
  definitions of d' and η in signal detection, **3854**
  demodulation and detection processes in, **959**
  discrimination of signals in noise, **1357, 2008**
  error-correcting codes, with constant bit-rate of transmission, efficiency of, **1358**
    mathematical theory of, **1683**
    using regenerative shift-register sequences, **257**
  error probability for optimum codes in Gaussian channel, **2745**
  for infinite alphabets, **958**
  physical interpretation of Shannon's ambiguity, **3853**
  sampling of signals without d.c. components, **1356**
  speech transmission, threshold levels for quantization, **3855**
  in telecommunications, **3952**
Components, (See also Circuits, printed; Electronic equipment)
  electroforming technique for complex shapes, **4143**
  microwave, production testing equipment for, **221**
  selection from random samples, **659**
Computers, analogue, analysis of British models, **31**
    using capacitor storage unit, **32**

Computers, analogue d.c., negative-resistance circuit for, **3605**
    differential analyser, Fourier analysis by, **33**
    for evaluating radar performance, **1465**
    function generators, biased-diode, design of, **2861**
      rotating-disk type, **2858**
      for sines or cosines, **1457**
      tapped-potentiometer, **35**, quadratic interpolation by, **2133**
    using loaded potentiometers, error reduction technique, **3969**
    matrix programming of, **347**
    multiplier, using Hall effect in semiconductors, **349, 350, 2131**
    multiplier-divider, using thyrite resistors, **1458**
    for prediction of sound propagation, **3207**
    ratio calculator, **1102**
    resistance-network, design principle for, **2480**
      use of, **2481**
    for simulation of aircraft performance, **1466, 2477**
    storage systems for, magnetic-drum, **348**
  analyser for relay-circuit contacts, **1460**
  control systems with 'intelligence', **716**
  data reduction system using scanned photocathode and image dissector, **1105**
  digital, ACE, **2128**
    ADDAM II differential analyser, **1780**
    adders, controlled by magnetic cores, **3210**
    applications, for lens designing, **2483**
      for transient response of linear control systems, **2130**
      for verification of logic structure of switching system, **2134**
    for automatic graph plotting, **2859**
    binary multiplication in, **2856**
    capacitive sensing system for punched cards or continuous foil, **1455**
    character display system for output of, **3968**
    counting circuits for, using transistors and magnetic cores, **2479**
    C.S.C.E. Pisa, using parametric cells, **3966**
    data-processing, automatic failure recovery system, **1453**
      automatic magnetic 'reading' equipment for, **3586**
      information handling in, **1454**
      magnetic-tape recording system for, **1464**
      tape amplifiers for, **27**
    efficiency of logical elements as multipurpose bias devices, **1461**
    electromechanical input-output equipment, **26**
    high-speed, using ferrite cores and transistors, **2127**
      test generator for, **3585**
    with inductive control of switching, **3967**
    'laddic' ferrite device for switching in logic circuitry, **1463**
    logic synthesis of high-speed comparators, **1456**
    logic systems, using magnetic elements, **1104**
      based on signal phase in nonlinear reactances, **2126**
      using transistors and square-loop ferrite cores, **351**
    magnetic-core matrices for logical functions, **2860**
    magnetic materials for storage and switching, **1782**
    operation of, **25**
    parametric subharmonic oscillators for, **3590**
    'parametron' reactance element for, **3588**
    pulse generator using transistor blocking oscillator with saturable transformer, **3970**
    rectifier networks for, **29**
    sequence transducers, network analysis of, **352**
    for simple algebraic functions, **1452**
    sin N, cos$N$ and $N^{1/m}$ computations by, **2857**
    for spatial problems, operating on information in planar form, **30**
    standard block design using transistors, **2855**
    storage systems, ferrite-core, using transistors, **1783**
      ferrite plates for end-fired type, **36**
      ferroelectric, **717, 1781**
      magnetic, using coated glass rod, **1462**
      magnetic-core, using core-threading technique, **3587**, noise problem in, **1787**
      magnetic-disk, **2129**
      magnetic-drum, control apparatus, **346**, track switching system for, **718**
      magnetic-film and ferrite-core characteristics, **3212**
      matrix-type, using ferrites, **2482**
      punched-tape, **1785**
    storage and processing of data using magnetic tape, **1786**
    switching circuits using transistors for, **1784**
    switching elements for, 'cryosar', **3211**
      superconducting, **3209**
    tabulated reference to 27 models, **1779**
    test generator for, variable-frequency, **3591**
    transistor, operating experience with, **2132**
    1-Mc/s, transistor circuits for, **3229**
  digital/analogue conversion, using bistable multivibrator, **3206**
    using cryotrons, **1103**
    for storage-tube deflection, **2135**
  printing of pulse-code data using shaped-beam c.r. tube, **34**
  random-number generator using subharmonic oscillators, **2476**
  reliability of computation in presence of noise, **345**
Conduction, in solids, theory of, **485**
  surface, of insulating solids, criterion for, **3252**
  theory of electron transport in magnetic fields, **4014**
  in ThO_2 crystals, polarization effects in, **3335**
Conductivity, h.f., of metals, quantum theory of, **762**
    quantum theory of surface impedance in magnetic field, **763**
  induced by radiation in CdS and polyethylene, **2672**
  of metals, evaluation of, **1507**
  of monovalent metals, **4015**
Conductors, charge penetration in, **3251**
Conductors, penetration of transient e.m. field in, **2905**
  solution of Bloch's equation for electrons in, **1914**
  with wavy interface, e.m. field distribution in, **2904**
Conferences and conventions, acoustics, Moscow, June 1957, **661**
  British Association Meeting, Glasgow, Sept. 1958, **1171, 1202**

SiO_2 and GeO_2, infrared studies on polymorphs of, **205**
with zinc blende structure, calculation of lattice oscillations in, **3413**

D

Delay lines, (See also Computers, storage systems)
magnetostrictive, for pulsed video signals, **1134**
torsional, **2881**
quartz, for radar systems, **2511**
ultrasonic, design of, **28**
Hg, characteristics of, **361**
measurement method for, **2698**
Detection, of asymmetric-sideband signals in noise, **248**
of co-channel f.m. signals, by correlation method, **581**
microwave, tests on coaxial diodes for, **2794**
power-law, with 3 input signals, multiple Fourier analysis for, **2382**
of pulsed signals in noise, optimum filter functions, **247**
response of nonlinear devices to band-limited h.f. signals and noise, **1674**
step system for multiplex systems, **590**
Detectors, correlation devices for weak signals, **3099**
correlation function of output noise with biasing and limiting effects, **2005**
diode, analysis for asymmetric-sideband signals, **249**
optimum, with log I_0 characteristic, for weak signals in noise, **2004**
phase, diode, push-pull, theory and design curves for, **1152**
product-type, using pentagrid converter, **2898**
for symmetric- or asymmetric-sideband signals, **580**
Dielectric constant, contribution of exciton to, **1831**
of conducting liquids, l.f. measurements, **215**
measurement, at microwave frequencies, bridge method using coaxial cable, **921**
method based on Weissfloch transformation theorem, **4153**
static, molecular theory of, **761**
Dielectric properties, of glacier ice, **1994**
of ice crystals, **1600**
of low-loss materials, free-space mm-λ technique for measuring, **2348**
measurement bridge for 10 c/s–50 kc/s, **1305**
measurement technique for liquids, using H_{01} resonator, **922**
Onsager's theory of, **392**
polarization of gases, quantum theory for, **2901**
of polycrystalline stannates and cerates, **2626**
Dielectrics, (See also Insulating Materials)
artificial, anomalous dispersion in, **482**
dispersive, for beam scanning, **2124**
$\lambda/4$ matching of, **2125**
formed by array of thin films, **1154**
rod-type, reflections from, **2123**
$BaTiO_3$, breakdown field of, temperature dependence of, **2627**
ceramic, effect of compression on permittivity, **481**
thermal conductivity of, **2628**
low-temperature properties at 9·1 kMc/s, **1601**
thermal expansion coefficient of, **2629**
Ba(Ti,Sn)O_3 and Ba(Ti,Zr)O_3 ternary systems, **838**
ceramic, after-effect in, **3328**
light-weight, **839**
gaseous, C_4F_8, properties of, **3415**
inhomogeneous electrical dispersion phenomena in, **837**
$(NH_4)_2$ SO_4 and $(NH_4)_2$ BeF_4, transitions in, **836**
nonferroelectric, relaxation polarization and losses in, **480**
solid, impedance of layers of, **2271**
Diffraction, acoustic, of converging beams, **2813**
of acoustic and e.m. waves, asymptotic solution of problems in, **1859**
effect of fluctuations on intensity distribution near focus of lens, **2917**
by smooth object, geometrical theory for, **3265**
by wedges or corners, for plane, cylindrical or spherical wave, **1167**
of e.m. waves, by circular hole in plane screen, comparison with optical microscope, **2206**
by dielectric strips, **1516**
at ideally conducting flat screens, **1515**
by imperfectly conducting wedge, **4028**
Kirchhoff-Young theory of, **2918**
by perfectly conducting half-plane, **1168**
by perfectly conducting solid, **774**
polarized, by wide slit and complementary strip, **411**
skew-plane, by absorbing wedge, **3266**
by slit, approximation for, **1851**
by slit and rectangular apertures, intensity distribution near focus **3256**
in inhomogeneous media, asymptotic theory of, **2539**
geometric theory of, **2538**
of light, by ultrasonic waves, intensity distribution for, **1051**
at oblique incidence, **1049**
of ultrasonic waves, by arrays of rods, **1048**
Direction finders, c.r.o.-type, s.w., comparison of, **2256**
Direction finders, c.r.o.-type, s.w., Telefunken, **2257**
2-channel, integration method for improving bearing evaluation in, **2258**
h.f., with averaging system and automatic read-out, **2600**
interferometers for tracking airborne vehicles, **1583**
long-base-line, error reduction in, **3720**
v.h.f., automatic, using rotating Adcock aerial, **817**
true-phase capacitive goniometers for, **4068**
Direction finding, coherent-wave, component determination using 2-channel c.r. d.f., **816**
h.f., errors caused by nearby vertical reradiators, **1203**
3-dimensional, using spaced aerials, **3314**
Discharge tubes. See Valves, gas-filled.
Discharges, (See also Breakdown; Plasma)
cold-cathode, space-charge effects in, **1833**
effect of coupling oscillator coil to discharge tube, **1156**
electrodeless, in air at reduced pressure, effect of magnetic field on, **83**
glow-to-arc transitions, ionizing-potential space waves in, **3254**
glow-type, hollow-cathode, **2909**
h.f., torch-type, electron temperature and noise in, **3253**
Hg-vapour, noise spectra measurements in, **4019**
Joshi effect, potential variation in, **2530**
low-density, theory of cathode sheath in, **82**
propagation of non-ionizing shock waves in, **4016**
pulse, gas recovery after, method of studying, **2531**
'silent', r.f. oscillations in light and darkness in, **1155**
space-charge field-emission hypothesis applied to, **2907**
thermal noise in, **1158**
wire–cylinder, in air, in relation to space-charge field-emission hypothesis, **394**
Discriminators, frequency, linear, wide-band, using transmission lines, **2526**
microwave, for stabilizing klystron oscillators, **1487**
Distortion, of a.m. and f.m. signals, **2007**
harmonic, in f.m. system, **1504**
of signal on h.f. carrier in circular waveguide, **3473**

E

Earth, conductivity, mapping by radio technique in U.S.S.R., **434**
measurement of, **3420**
Earth satellites, applications, for transoceanic communication system, **2012**
for verification of theory of relativity, **3684**
atmospheric density determination, lifetime data for, **3686**
from orbital data, **3689**, **3695**
irregularities in, **2571**
at 200–400 km, **2955**
atmospheric pressure and density measurements by, **1871**, **3694**
instrumentation for, **439**
cosmic-radiation investigations by, **3690**
analysis of, **2958**
instrumentation for, **3663**
Doppler measurements on, **1191**, **3697**
velocity determination from, **442**
electron energy levels at 470–1880 km recorded by, **3294**
errors in tracking, due to refraction at ionospheric heights, **3698**
Explorer series, firing system, instrumentation and tracking of, **1546**
flight principles and velocity data, **2950**
geodetic information from, **1185**
geomagnetic field measurements by, **3693**
gravitational torque on, **117**
ion-concentration measurements by, **3696**
ionization trails, radio reflections from, **121**, **2963**
ionosphere investigation by, **1873**, **3295**
launching problems, **3680**
lifetime determination and orbit perturbations, **3681**
optical observation, over polar regions, **793**
tracking program for I.G.Y., **2566**
in U.S.S.R., **3288**
orbital acceleration of, atmospheric effects in, **2564**
orbital data, calculations, **3682**
and geophysical factors, **3683**
value for earth's flattening obtained from, **2567**
orbits of, air-drag effect on, **3287**
allowing for earth's oblateness, **1184**
described by difference equations, **119**
irregularity in, **797**, **1543**, atmospheric tides as cause of, **2565**
cause of air resistance changes in, **1186**
coordinate system for, **3687**
determination from tracking data, computer program for, **2568**
Doppler method for determination of, **1188**
effect of earth's oblateness on, **2233**, **2234**
prediction of, **2232**
around unsymmetric central body, **1541**, **(D)1866**
polyhedral, for accurate orbital data, **794**
radar scattering from, effect of Faraday rotation on, **1345**
radio-astronomy investigations by, **3292**
radio observations of, comparison of methods of studying ionospheric structure by, **799**
derivation of ionosphere data from, **1548**
ionospheric effects on, **1549**
in Italy, **1192**
signals from, Faraday fading of, deduction of ionospheric electron content from, **2572**, correction for, **450**
Faraday rotation of, **796**
magneto-ionic effects up to 2 000 km in, **2961**
recording of, **2573**
solar corpuscular radiation investigated by, **3293**
time-dilation measurement method, **3688**
tracking, methods for, **122**, **4047**
'minitrack' system for, **1190**
photoelectric optical method for, **1189**
Earth satellites, tracking, 108-Mc/s interferometer system for, **123**
trajectory determination, ground equipment for, **441**
U.S. and U.S.S.R., tabulated data on, **3679**
telemetry data for, **124**
U.S.S.R., observations related to ionospheric propagation, **2952**
tracking by Doppler measurements, **443**
weather observation by, **2360**
instrumentation for picture transmission in, **2715**
1957 α (Sputnik I), determination of orbit and regions of reception, **120**
Doppler measurements at Johannesburg, **445**
electron density determinations in outer ionosphere by, **3298**
ionospheric information from, **3296**, **3297**
ionospheric investigation by simultaneous Doppler shift measurements of, **1874**
radio observations of, in Japan, **446**
results from, **1869**
in southern hemisphere, **444**
rotation of, **795**, **1187**
1957 α and β, radio observations, in Germany, **2237**, **3289**
Royal Society discussion, **2951**
tracking of, using h.f. d.f., **798**
1957 β (Sputnik II), brightness fluctuations of, **2956**
change of inclination of orbit of, **1542**
cosmic-ray intensity variations recorded by, **2959**
field-strength recordings at 40 Mc/s in West Germany, **3291**
gravitational-field investigations by, **792**, **4048**
instrumentation of, **440**
last minutes of, **447**
orbit of, changes in inclination to equator, **2235**
motion of nodal line in, **118**
radar observations of, **3290**
solar-flare effect on period of, **449**
1958 α (Explorer I), cosmic-ray information from, analysis in Japan, **448**
instrumentation for, **2964**
instrumentation of, **1547**
1958 β (Vanguard I), instrumentation, orbital data and applications of, **1868**
orbit of, determination of coefficient J of gravitational potential from, **1867**
variations related to gravitational field, **2236**
solar effects on motion of, **4050**
1958 β and δ, effect of corpuscular radiation on acceleration of, **2960**
1958 δ (Sputnik III), antipodal reception conditions, **2957**
auroral ionosphere investigation using, **4052**
diurnal lapse of signals from, **2954**, **4049**
instrumentation and results of observations, **1550**
ionized tracks as cause of signal strength fluctuations, **2953**
orbital data for, **1545**, **3685**
radio observations of, **2569**
signal-strength recordings, in Alaska, **1193**
in Ohio, **2570**
upper-atmosphere investigation by, **1872**
1958 ε (Explorer IV), cosmic radiation increases detected by, **3692**
observations of radiation belt by, **2238**
Electrets, $CaTiO_3$, anomalous stability of, **1603**
phenomenological theory of, **1602**
Electroacoustics, standards, calibration and errors of, **3186**
Electrodynamics, classical, as distribution theory, **404**
nonlinear, formation of discontinuities in, **2914**
Electroluminescence, (See also Phosphors)
in Cu_2O, and current creep effects in rectifiers, **3005**
display panels, for automatic displays, **3434**
for character generation and storage, **1654**
transfluxor-controlled, **568**
display systems, ELF, **225**
'sylvatron', **224**
in GaP and InP, bimolecular transitions at rectifying junctions, **3737**
of insulated particles, **1215**
mechanism of, **1597**
'memory' effect in enhancement of, **1213**
modulation of photoluminescent emission by alternating field, **831**
processes and application to picture tubes, **1909**
screens for television display, problems of, **566**
in SiC, **3003**
in SiC p-n junctions, **1910**
Electrolyte tank, anisotropic field plotting in, **3825**
servo system for automatic tracing of equipotential curves, **3428**
space-charge simulation by current injection, **2356**, **2708**
Electromagnetic field, in stratified medium, excited by dipole in surface, **2920**
Electromagnetic theory, electron wave functions, consistency condition for, **2537**
e.m. waves in crystal with exciton absorption, **409**
helical coordinate system for, **773**
of induction, **407**
Maxwell's equations, in general relativity theory, **1514**
solution in terms of spinor notation, **2900**
uniqueness criterion for solutions of, **3628**
Maxwell's and Helmholtz's equations, application of distribution theory to, **405**
of 'singular' induction, **406**
Electron beams, axially symmetric, with uniform velocity profile, **3526**
distribution of particles with multiple scattering, **1837**
effect of inclination of focusing electrodes on formation of, **2060**
homogeneous, plasma heat-exchange technique for producing, **397**
influence of angle of diffusion on energy spectrum in thin films, **3255**
magnetic analysis based on Lorentz effect in, **2199**
Electron beams, magnetically focused, anomalous noise in, **2789**
characteristics of, **3888**
periodic permanent-magnet structures for, **1021**
parallel-flow, periodic e.s. focusing of, **2061**
partially neutralized, perveance and Bennett pinch relation in, **84**
relativistic, intense, behaviour of, **4017**
rotating, space-charge-wave harmonics and noise in, **1736**
sheet-type, aberrations in, **2908**
space-charge in, compensation of, **1836**
space-charge flow in, solution of equations for, **764**
splitting effect on penetrating magnet, **3636**
stationary, magnetic forces and relativistic speeds in, **85**
theory of formation and trajectory in magnetic field, **2059**
Electron emission, (See also Cathodes; Photoelectric emission)
field-type, total-energy distribution for, **2197**
measurement of, **2198**
from Hg films in discharge tube, **1157**
from Mo, after electron bombardment, **3258**
secondary, due to ion beam, energy spectrum analysis, **1838**
of metals, theory of, **3257**
from MgO films, **2316**
from Ni, **3789**
thermionic, from Mo, effect of magnetic field on, **1945**
wave-mechanics correction of Richardson-Dushman equation, **2912**
Electron gas, dielectric formulation of many-body problem for, **1830**
high-density, magnetic susceptibility of, **759**
Electron guns, for kinescope, annular, **652**
high-transconductance, **322**
electrode requirements for prescribed field distribution, **323**
magnetically shielded, electron-beam dynamics of, **1031**
magnetically shielded and immersed, perturbations in beams from, **(D)2429**
Pierce-type, design theory for, **(D)653**
'ramp'-type, space-charge-limited crossed-field, theory of, **3894**
for solid and hollow cone-type beams, **2430**
toroidal, for dense hollow beams, **3527**
Electron lenses, asymmetric, stigmatic image in, **3075**
unipotential design of, **937**
e.s., correction of aperture error by space charge, **4171**
ion-focusing properties of quadrupole pair, **2721**
magnetic, induction along axis of, measurement of, **2704**
weakly convergent, spherical aberration in, **3838**
Electron microscopes, cathodes for, oxide-cored, **3078**
point-type, **3077**
remote-focus, **936**
emission-type, using secondary electrons, **1330**
using ultraviolet radiation, **1987**
e.s. charging of photosensitive material in, **1988**
chromatic variation of magnification in, compensation of, **3076**
field of series of cylindrical magnetic lenses, **3445**
with highly biased electron gun, **3443**
image contrast analysis, **3444**
space-charge aberration and resolving power of, **3074**
Electron microscopy, image in, e.s. method for obtaining, **1331**
obtained by negative-ion bombardment, **567**
review of developments since 1957, **3832**
shadow casting, use of carbon films in, **938**
Electron optics, diffractograph for continuous recording, **3442**
energy spectrum of electron beam reflected by metallic object, **399**
e.s. immersion objectives, computation methods, **3073**
shadow technique, field superposition for increasing sensitivity, **3441**
Electronic applications, automatic character recognition systems, **1991**
automatic pattern recognition, by analogue apparatus, **2371**
using flying-spot scanner, **2372**
catapult end-speed recorder, **924**
electron-bombardment processing of materials, **4168**
e.s. teletypewriter for data processing, **3086**
hygrometer, microwave-refractometer, recording-type, **3070**
in inertial guidance system for space flight, **3839**
manometer, microwave, for pressures $>0\cdot1$ mm Hg, **565**
in medicine, control of ventricular contraction in experimental heart block, **929**
ingestible radio capsule, **1326**, **1327**, **3834**
microwave radiator for heat therapy, **2361**
pulse generator for electrocardiograph, **4169**
sensitivity of v.l.f. amplifiers for electromyography, **230**
variable-pulse stimulator, **229**
microwave model of human eye, **1325**
mμs light source using Si p-n junction containing P, **3435**
observation of confined detonation processes using microwave interferometer, **3068**
photoelectric apparatus with mechanical scanning for photometry, **4167**
plasma engine, **3833**
radar meter for vehicle speed measurement, **1898**, **1981**
radar technique, for detection of shock waves, **3447**
for shock-wave velocity determination, **1658**
in railway industry, **2717**
seismic transducer for visual recording, **3069**
Electronic applications, 'tellurometer', for measurement of distance, **1980**
video differential planimeter, **3067**
Electronic equipment, in Brazil, **3176**
in naval ordnance, design problems, **2803**
production and assembly techniques for, **1037**
reliability of, calculations on, **2806**
design factors for, **2076**
'interaction' in, **1038**
numerical approach for, **2804**
Soviet, review of, **3899**
transistorized, data on, **3592**
Electrons, collision probability in gas, microwave measurement method, **768**
relativistic flow in straight lines with no external magnetic field, **396**
slow excitation of molecular vibration and rotation by, **3259**
spin kinematics in uniform field, **99**
Electrostatics, generation of static charge on high polymers, **4013**
interaction of two charge distributions, **760**
potential and capacitance of torus, **4012**
potential distribution near p-n junction, **1506**
simple method of calculating capacitance, **2193**
surface charges on insulators, **2527**
Equalizers, constant-*S*, **3226**
Laguerre-function, using passive elements, **1481**
Ether, deflection of light waves by movement of, **3228**
Exhibitions, Audio Fair, London, April 1959, **2095**
electronic computers, London, 1958, **715**
German Radio, Frankfurt, 1959, **3898**
National Radio, London, Sept. 1959, **3897**, **4255**
Physical Society, London, 1959, **1749**
R.E.C.M.F., London, April 1959, **2802**
S.B.A.C., Farnborough, Sept. 1959, **4256**

F

Faraday effect. See Magnetic effects.
Ferrimagnetic materials. See Ferrites.
Ferrites, with anomalous magnetization loops, hysteresis losses of, **3400**
Ba, anomalous characteristics of samples containing $CaO.SiO_2$, **2685**
dielectric properties of, anisotropy in, **3807**
magnetization curve analysis, **3806**
substitution of cations in, **540**, **541**
$BaO.6F_2O_3$, magnetization and structure of, **899**
containing Co, perminvar effect in, **1284**, **2324**
semiconducting properties of, **4135**
dielectric-constant measurement bridge for, **4158**
Dy-Y, Dy-Gd and Dy-Er mixed garnets, properties of, **2331**
e.m. fields in ellipsoidal samples, **1286**
Er garnet, Al- and Cr- substituted, interpretation of properties of, **1290**
Fe_3O_4 and $(NiO)_{0\cdot75}(FeO)_{0\cdot25}Fe_2O_3$, Hall-effect measurements on, **3403**
'ferroxcube', permeability tensor of, at 24 kMc/s, **1293**
'ferroxplana', crystal-oriented, **2687**
flux reversal in, modified rotational model for, **900**
frequency characteristics of, **3398**
garnets, domain observation by transmitted light, **200**
growth of single crystals of, **1289**
Gd-Er and Gd-Y mixed garnets, properties of, **1633**
Gd-Fe garnet, microwave resonance in, two-sublattice model for, **3043**
as gyrotropic media, reciprocity relations for, **3044**
hysteresis loop evaluation by computer, **2326**
kinetic processes in, phenomenological theory of, **1285**
Li, susceptibility of, transverse, dispersion in range 10–10 000 Mc/s, **1288**
Li-Zn, magnetic properties of, **1957**
for magnetostriction oscillators in filter circuits, **1954**
measurements by resonance-cavity methods on, formulae for, **545**
Mg, effect of Mn and firing conditions on, **903**
effect of oxygen pressure on, **1287**
solubility of MgO in, **2688**
Mg-Mn, magnetic viscosity in hysteresis loop tracings, **2325**
microstructure and properties of, **4133**
microwave Faraday effect and birefringence in, **1632**
Mn, domain-wall motion and resonance in, **1958**
magnetic properties and disaccommodation of, **2327**
Na_2O-SnO-Fe_2O_3, **904**
neutron irradiation effects on Curie temperature of, **898**
Ni, effect of divalent-ion substitutions on magneto mechanical properties of, **1292**
grain growth in, **544**

Ni-Co, magnetic resonance studies during reaction, **3042**
and Ni ferrite-aluminates, resonance measurements on, **2689**
Ni-Fe, magnetic anisotropy in, low temperature transition of, **902**
$NiMnO_3$, resonance in, **543**
$NiMnO_3$ and $CoMnO_3$, crystal structure of, **199**
Ni-Zn, effect of Co on magnetic dispersion, **3808**
hysteresis reduction by transverse field, **3244**
paramagnetic susceptibility of, temperature dependence of, **3041**
permeability variation with time in, **4136**
oriented, with cubic anisotropy, **3399**
permeability and loss data for cores, **897**
polycrystalline, resonance in, spin-wave analysis of, **777**
power-gain relations for 3- and 4-frequency excitation, **3045**
preparation of, by continuous electrolytic co-precipitation, **1959**
properties and applications of, **4134**
rare-earth garnets, resonance in, **2690**
rare-earth orthoferrites, weak ferromagnetism in, **905**
Ferrites, resonance in, magnetostatic modes of, **3813**
properties and microwave applications of, **4140**
theory of, **906**
resonance line widths, and g-factors in, **3402**
measurements in cross-guide coupler, **3810**
resonance in spheres, magnetostatic modes in, **908**
reversal of temperature coefficient by d.c. field, **2686**
r.f. properties of, weak-field measurements of, **3815**
single-crystal, domain configurations on, **1283**
square-loop, rings, test equipment for, **4155**
storage properties of, test methods for, **3397**
switching-time investigation using asymmetrical pulses, **3404**
storage-type, magnetic reversal in, **4137**
susceptibility of ellipsoid in uniform field, **3809**
switching in, rotational, mechanisms of, **1634**
thermal expansion coefficient of, **4128**
$TiFe_2O_4$-Fe_3O_4 system, properties of, **542**
transparent, domain observations in, **1956**
Y-Fe garnet, effective exchange constant in, **3401**
magnetic anisotropy constant of, **901**
magnetoacoustic resonance in, **201**
permeability spectra of, **1291**
resonance in, **4138**
effect of rare-earth impurities on, **3811**
resonance instabilities causing microwave and l.f. oscillations, **198**
resonance line widths, **2330**
at liquid-He temperatures, **907**
maximum at low temperature, **3812**
with substituted Cr, absorption curve, variation in width of, **2329**
g-factor of, **2328**
Y and Gd garnet, resonance absorption with increasing power level, **4139**
Ferroelectric materials, (See also Piezoelectric materials)
anomalous polarization in, **1911**
(Ba,Sr)TiO_3, thin films, vapour-deposited in electric field, **4083**
Ba(Ti,Sn)O_3 and Ba(Ti,Zr)O_3, polarization variation with temperature, **3745**
$BaTiO_3$, ceramics, anomalous residual polarization in, **3327**
polarized properties of, **479**
primary pyroelectric effect on, **156**
crystals, triangular, growth of, **1599**
domian structure observed by electron microscope, **158**
domains in, antiparallel, during polarization reversal, **2634**
effect of space-charge fields on, **2274**
electron paramagnetic resonance in, **476, 477**
hysteresis loops and pyroelectric effect in, **3332**
irradiation effects on coercive field of, **1913**
motion of 180° domain walls in, **155**
polarizability increase during switching, **3744**
polarization changes during aging of, **844**
polarization reversal in, **159, 3007**
spontaneous polarization in, ultra-low-velocity component of, **160**
switching current in, domain model for, **2635**
switching time at high voltages, **478**
switching velocity in, pulse-width dependence of, **2275**
transition to ferroelectric state in, **843**
CaSr(Ti,Zr)O_3 and Na(Nb,Ta)O_3 solid solutions, nonferroelectric phase transitions in, **1912**
$Cd_2Nb_2O_7$, preparation of, by anodic spark reaction, **2276**
ceramics, charge release for different temperature and stress conditions, **2630**
energy loss processes in, **1217**
ceramics and crystals, review of, **153**
colemanite, properties of, **3741**
domain structures of, powder-pattern techniques for delineating, **4085**
domain wall theory for, **3740**
hysteresis loops of, growth of, **3329**
KD_2PO_4, magnetic resonance spectrum and relaxation in, **3743**
KH_2PO_4, properties of, **3331**
$KNbO_3$-$KTaO_3$ system, transitions in, **3330**
$LiH_3(SeO_3)_2$, crystallography, dielectric and thermal measurements on, **4084**
$Li(N_2H_5)$ SO_4, **840**
metaniobate and metatantalate ceramics, properties of, **3326**
$(NH_4)HSO_4$, with low coercive field, behaviour in range −3° to −119° C, **841**
PbNi and PbMg niobates, temperature dependence of permittivity and loss angle, **2631**
Pb_2ScNbO_6 and Pb_2ScTaO_6, temperature dependence of permittivity and loss angle, **2632**
properties and selection of, **154**
Rochelle salt, Curie temperature and domain structure of, **1218**
hysteresis and after-effects in, **3008**
local-field theory of clamped crystal, **484**
$SrTiO_3$, electron paramagnetic resonance of Mn ions in, **2633**
stability of, **483**
thermal fluctuations of electric polarization in, **842**
triglycine sulphate, polarization reversal by sideways expansion of domains, **3742**
radiation damage in, **2273**
second-order transition in, **157**
Ferromagnetic materials, (See also Ferrites; Magnetic properties)
α-Fe_2O_3, magnetostatic energy and magnetic anisotropy of, **893**
alloys, Co- and Fe-rich, magnetization of, **3392**
Co-Gd, magnetic moments of, **2321**
Co-Ni, domain-structure changes after quenching, **192**
CrTe, Hall effect in, **2681**
crystal anisotropy and magnetostriction of, **3393**
dilute, experimental investigation of, **1631**
Fe-Al, Hall effect at Curie point in, **2680**
Fe-Co, Hall effects in, **1953**
Ferromagnetic materials, alloys, Fe-Si, temperature dependence of magnetic properties, **193**
Fe-Si-Al, sendust flake, for l.f. applications, **894**
Heusler-type, Ag and Au, **1950**
Mn-Al, metallographical investigation of, **2679**
Mn-Bi, films, magnetic writing on, **539**
Ni-Cu and Ni-Cr, temperature dependence of resistance of, **3805**
Ni-Fe, films, magnetization reversal by rotation and wall motion in, **1955**
orientational superlattices arising from mechanical deformation, **1276**
Ni_3Fe, antiferromagnetic orientation in, **537**
Ni_3Mn, change of sign of Hall constant in, **2675**
permalloy, direct observation of spin-wave resonances in thin film, **191**
perminvar, influence of magnetic annealing on, **3396**
magnetic annealing in, **3797, 3798**
measurement of domain-boundary propagation velocity by Kerr effect, **194**
Co, films, resistivity of, **162**
resistivity and thermoelectric power of, **487**
leakage-field determination using divergent electron beam, **202**
nuclear resonance in, **4126**
polycrystalline, magnetic resonance of, **3802**
creep of asymmetric hysteresis cycles in, **204**
cube-oriented sheet, **896**
Curie-point phenomena in, **3391**
cyclic remagnetization of, noise measurements on, **3796**
domain boundary configuration during magnetization reversals in, **2319**
domains in, observation by magneto-optical Kerr rotation, **1281**
thermal activation of, **1275**
width of boundary layer between, **2676**
elastic-wave damping in, high-frequency, **1278**
electron diffraction method of analysis of, **3801**
electron mirror microscopy of stray fields in, **3800**
Fe, armco iron, ultrasonic investigation of deformation in, **4124**
domain distribution between two phases in single-crystal disk, **3038**
domain structure, influence of demagnetizing field on, **2677**
eddy-current losses in, **4130**
films, evaporated, chemisorption of O_2 in, **1295**
magnetic anisotropy in, **2683**
influence of carbon inclusions on mobility of Bloch walls, **3794**
Fe and Ni films, magnetization vectors determined from magnetoresistance effect, **3040**
Fe and SiFe, magnetothermal effects in, **4129**
films, energy relations for magnetization analysis, **3394**
monitoring hysteresis loop during and after deposition, **2682**
Hall effect in, measurements on, effect of crystal anisotropy and magnetostriction in, **3803**
theory of, **1277**
hysteresis in, calculation of, **197**
hysteresis cycles in, creep of, **547**
interatomic distances in, **891**
irradiation effects on, **2646**
magnetite, spin-fluctuation scattering of neutrons in, **4127**
magnetization of, change with hydrostatic pressure, **892**
model for interpreting domain effects on electron beam, **3407**
mu-metal, 'after-effect' in, **2320**
Ni, domain distribution in, influence of temperature on, **3795**
Hall effect at low temperatures in, **2322**
resonance in, **2684**
ultrasonic velocity and attenuation changes with magnetization direction, **4125**
ultrasonic wave propagation in, **1951**
Ni, films, cathode-sputtered, thermal transformation of, **895**
electrolytically produced, properties of, **3804**
Hall effect in, **1279, 1280**
magnetic properties of, **3039**
magnetoresistance of, **1944, 3395**
Ni and Pd films, temperature dependence of resistance of, **3805**
particles in paramagnetic alloy, variation of spontaneous magnetization with temperature, **2678**
powder-core, temperature coefficient of initial permeability of, **1282**
radiation effects in, **196**
resonance and relaxation phenomena in, thermodynamic theory of, **538**
soft, flux reversal mechanism in, **3405**
spin-orbit coupling and extraordinary Hall effect in, **1952**
structure of, instability of Bloch walls due to interstitial atoms, **535**
superconductivity conditions for, **195**
Ferromagnetism, coupling of elementary domains in, **546**
effect of coupling between grains on hysteresis, **203**
excluded-volume problem and Ising model of, **3263**
fluctuating-field theory and low-temperature ordering, **536**
granular structures in, analysis of, **2318**
Heisenberg model for, equivalence of Bose-Einstein lattice gases to, **2913**
Field strength, (See also Reception; Wave propagation, e.m.)
measurements, recording and evaluation of, **3419**
Films, thin, absorption of e.m. wave by, optimum thickness for, **3268**
absorption/field-strength curves for, determination of width of, **3814**
Films, thin, Au, effect of Se film on conductivity of, **488**
Au and Cu, resistance variation and noise in, **3356**
magnetoresistance measurement circuit, **555**
microwave refractivity of, **1154**
oxide, on Al, impedance, rectification and electroluminescence of, **4141**
Sb, resistivity and magnetoresistance measurements on, **2693**
Filters, (See also Networks; Waveguides)
active, band-pass, 16–175-c/s, multirange, **3977**
using transistors and twin-T networks, **2156**
all-pass, for delay equalization in television transmission, **737**
attenuation characteristics, formulae for, **731**
band, normalized admittance curves and mismatch circles for, **734**
null-point, **736**
2-stage, with feedback amplification for bandwidth control, **735**
branched, **2151**
constant-k, stagger-tuned, for servo systems, **368**
crystal, lattice-type, symmetrical transfer characteristics of, **1121**
wide-band, design of, **1120**
development of technique in France since 1947, **2153**
elliptic-function, design curves for, **367**
i.f., permissible circuit impedances for f.m., **732**
triple-tuned, operational and design data for, **1803**
image-parameter, Tchebycheff approximations for, **2498**
ladder, band-pass, half-sections formulae for, **3223**
coupling coefficients for maximally flat amplitude response, **1478**
interchange of infinite-attenuation elements in, **2150**
LC, design curves for, **366**
low-pass/band-pass transformation of, **2152**
mismatch conditions for improving characteristics of, **1116**
optimum, design tables for, **49**
Zobel-type, simplified design method for, **3224**
linear, transfer-function relation for, **3607**
low-pass, *RC*, with optimum response, design data, **51**
response to finite-duration signals, **2390**
voltage-controlled, continuously variable, **1119**
magnetostrictive, narrow-band, **52**
mechanical, for communication equipment, **2155**
flexural vibrations in, **2154**
theory and technique of, **3225**
microwave, cavity-type, aperture-coupled, **1112**
for minimum insertion loss, **1117**
pulse-width, for television receivers, **1802**
rejector, bifilar-T, analysis of, **1122**
Tchebycheff-type, symmetrical, estimation of dissipative effects in, **50**
synthesis of, **3608**
time-symmetric, for gliding-tone analysis, **365**
wave, design of, network transformations for, **3222**
Zobel-type, for Tchebycheff insertion loss, **1118**
Frequency, control, automatic, using junction diode, for f.m. receivers, **951**
converters, ferrite 'serrodyne' for X band, **3942**
u.h.f., using nonlinear-capacitance diode, **3145**
dividers, harmonic-type, investigations on, **1132**
for pulse synchronization, **3232**
regenerative-modulator-type, process related to Mathieu functions, **2509**
using transistors, **378, 1133**
wide-band, **2508**
measurement equipment for transmissions from aircraft in flight, **3423**
measurements, using atomic clock, **1311**
pulse beat method for, **1643**
of response of electromechanical devices, **2079**
meter, microwave, H_{011}-mode, **4161**
multiplication, using counter circuits, **3614**
stabilization, using double mixing circuit, **738**
standards, Canadian, **2700**
using Cs beam, **2701**
Cs, 'atomichron', **550**, comparison of, **212**, drift in, **4148**
comparison with NH_3-beam maser, **915**
correction for earth's ellipticity, **4147**
N.P.L., circuits of, **2340**
portable, **3053**
microwave, using crystal oscillator, **1300**
using Na vapour, **4150**
for microwave spectrometers, **3054**
molecular, theory of cavity microwave spectrometer used with, **1641**
based on molecular-beam electric resonance in LiF, **4149**
NH_3, in terms of astronomical time, **914**
portable 15-Mc/s, **3052**
100-kc/s, comparator for, **1299**

Galvanomagnetic effects. See Magnetic effects.
Galvanometers. See Meters, galvanometer.
Gases, ionized, (See also Plasma)
auroral afterglow of nitrogen, **1510**
dependence of electron mobility on magnetic field, **3643**
electron and ion temperature difference in magnetic field, **2536**
irreversible processes in, **4020**
in strong fields, as hydromagnetic capacitor, **1843**
thermal diffusion in, **89**
transport phenomena in, considering electron-electron scattering, **402**
oxygen, attachment of slow electrons in, **2533**
Generators, (See also Oscillators; Signal generators)
frequency-sweep, using voltage-variable p-n-junction capacitor, **3986**
wide-band, with 100 kc/s–300 Mc/s sweeps, **558**
harmonic, efficiency with ideal rectifiers, **60**
microwave, using capacitive-mode crystal diode, **3991**
Generators, harmonic, using nonlinear reactances, **61**
pulse, mμs, calibrated, using coaxial line, **2706**
using half-cycle delay principle, **2501**
using vibrating-reed Hg switch, **2500**
using nonlinear amplifiers to shorten rise time, **1488**
for radar range calibration, **2352**
using transistors, **2161**
variable, using pulse transformer and transistor, **1128**
80-μs, 100-kW, for spectroscopy, **376**
pulse and square-wave, commercial, **2710**
random-function, with constant peak-to-peak amplitude, **373**
sine-wave, l.f., commercial, **552**
Geomagnetic storms, activity following large solar flares, **3284**
correlation with sudden disappearance of solar filaments, **2948**
recurrent, 1917–1944, related to solar prominences, **1865**
in relation to geomagnetic pulsation, **1537**
ring-current theory of, inadequacy of, **1536**
sudden commencements, observations at Tamanrasset, **1183**
propagation of, **3285**
time constants for, **1535**
Geomagnetism, activity, in polar regions, from report of French expeditions, S IV 2, **111**
related to green coronal-line intensity, **2949**
relation with solar flares, **113**
dynamo theory of, **108**
far-field discrepancies in cosmic-ray and surface data, **435**
field disturbances, correlation with earth currents, **4044**
due to nuclear explosions, **3669, 3670, 3671, 3672, 3709**
related to atmospheric circulation at 300 mb, **2229**
as relaxation variations, **2944**
due to solar plasma, **2560**
field fluctuations, irregular, diurnal variations of, **1533**
in 0·1–30-c/s range, **1532**
with 6-sec period, causes of, **2945**
field geometry at ionospheric heights, **3849**
field intensity, scalar, method for analysis, **109**
solar-eclipse effect on, **2561, 2562**
field measurement, using weak-field maser, **3823**
field micropulsations, in Alaska and California, **4045**
geographic variations, **2946**
field pulsations, auroral origin of, **2947**
related to oscillations of outer atmosphere, **3673**
field reversal calculations, **436**
field variations, e.m. fields induced by, **3668**
lunar tides at Kodaikanal, **1534**
lunar-diurnal, at Tamanrasset, **2228**
secular, relation to non-dipole fields, **790**
hydromagnetic waves above ionosphere, **110**
measurement with Rb vapour magnetometer, **112**

H

Hall effect, (See also under Semiconductors)
devices based on, **2692**
generators, semiconducting thin films for, **3349**
measurement apparatus, a.c., for ferromagnetic and semiconductor materials, **918**
Hearing, binaural fusion in, mechanism of, **1055**
definitions of d' and η in signal detection, **3854**
detection of signals in noise, **3540**
as function of frequency ensemble, **1052, 3539**
masking in, definition and index for, **3541**
stereophonic effect obtained with single signal, **1056**
threshold, and duration of tone pulses, **3909**
threshold shift, due to noise, **682, 1053, 1054**
relation with masking, **681**
Heating, eddy-current system using gas-filled triodes, **2716**
induction, generator using hydrogen thyratrons, **3439**
r.f., frequency stability of generators for, **933**
Hysteresis. See Magnetic properties.

I

Image converters, electron-acoustic, using piezo-electric plate scanned by electron beam, **679, 2084**
for military and scientific use, **2783**
pulsed, for observation of luminous discharges, **3522**
for quantity production, and definition of gain characteristic, **1404**
shutter-type, for multiple-frame photography, **2369**
Image intensifiers, cascade, fluctuations in, **3521**
with optical feedback, for picture storage, **1408**
solid-state, application of electroluminescence in, **1597**
Impedance, matched or optimum, assessment of, **37**
measurements, by differential bridge, between 10 kc/s and 10 Mc/s, **3429**
in waveguide, automatic frequency-sweep c.r.o. method, **220**
100 c/s–50 Mc/s, 3-branch phase-opposition circuit for, **554**
shunt, of resonant cavity, measurement method, **3421**
surface, measurement technique for v.h.f., using disk-terminated coaxial line, **1306**
quantum theory of, **1221**
Inductors. See Coils.
Information theory. See Communication theory.
Infrared, (See also Photocells)
physics and technology, **4010**
Insulating materials, (See also Dielectric properties; Ferroelectric materials)
ceramic, structure and properties of, **4142**
for magnet wires, **1635**
plastics, epoxy resins, properties of, **911**
polyethylene, oxidized, dielectric loss of, **3414**
polymers, dielectric losses and permittivity at cm λ, **3818**
Insulating materials, silicone, tabulated data on, **2694**
tape- and film-type, for electronic equipment, **1296**
Interference, (See also Noise; Reception)
from fluorescent lamps, **3463**
from industrial, scientific and medical apparatus and radiating receivers, **954**
from radar, in microwave communication services, **1353**
in shared-channel broadcasting, subjective tests, **3479**
suppression equipment for lifts and screened rooms, **4193**
from television receivers, reduction of, **955**
u.s.w., measurement equipment for, **2386**
Interferometry, double-beam, coherence requirements for, **398**
International Geophysical Year, coordination of observational program for, **1539**
Indian program, **3299**
Indian work during, texts of papers covering, **3699**
N.B.S. radio and ionospheric observations during, **4046**
organization and data-collection arrangements for, **1538**
program of atmospheric research, **1540**
R.S.G.B. progress report, **114**
for v.h.f. program, **115**
S.W.I. and disturbance warnings, improvement of, **116**
World Data Centre for rockets and satellites, **1194**
Inverters. See Converters, d.c./a.c.
Ionization, in homogeneous field, extension of Townsend's approximation formula, **2200**
Ionosphere, (See also Atmosphere; Earth satellites; Wave propagation, e.m.)
abnormal effects on cosmic noise at 10 m λ, **808**
absorption in, interpretation of variations in, **3716**
'riometer' cosmic-noise equipment for measurement of, **1566**
at 5 Mc/s over Delhi, **810**
in arctic, measurements from drifting observatory, **3717**
in auroral zone, rocket measurements 100–210 km, **1560**
D region, absorption in, explanation of daytime constancy of, **809**
rocket measurements of, **2972**
arctic, electron-collision frequencies in, **1886**
f_{min} and sudden disturbances of, **2588**
low-frequency sounding and reaction-rate investigation of, **1553**
disturbances in, effects on communication circuits, **573**
sudden, effect on 2·28-Mc/s pulse reflections, **2971**
travelling, night-time, **2580**
drift in, evaluation by method of 'similar fades', **801**
measurements at l.f., **1198**
signal-pattern analysis for, **1884**
E region, effect of ion production and recombination on wave scattering in, **4059**
geomagnetic distortion of, **2246**
lower, horizontal drifts and temperature in, **804**
measurements during solar eclipse, **3306**
size of irregularities in, **4054**
structure and variations of, **1554**
turbulence due to e.m. forces and wave scattering in, **4060**
E and F regions, drift observations at Ibadan, **1557**
E_s layer, long-term variations in Japan, **127**
lunar influence at Huancayo, **3305**
lunar-tide observations at Ibadan, **1880**
polar, analysis of ionosonde data, **1561**
spiral, occurrence of, **3304**
spread-F and radio-star scintillation, causes of, **2970**
survey of data, **1879**
v.h.f. observations in U.S., **2587**
E_s and F_2 layers, comparison of data on, **2578**
E_{2s} layer, lunar tides observed at Brisbane, **132**
effects of nuclear explosions on, **3709, 3712, 4056**
radio observations of, **2969**
in recordings of atmospherics and solar r.f. bursts, **3711**
in vertical-incidence absorption measurements, **3710**
effects on radio reflections from moon and solar corona, revised formula for, **2583**
effects related to cosmic noise level variations around 80 Mc/s, **2582**
effects of strong gyro-waves in, **3308**
electron density of, computations of, **126**
daytime decay variations with height, **3708**
investigations by rocket in U.S.S.R., **2965**
measurements using rocket-to-ground c.w. transmission, **3714**
profiles, during I.G.Y., **791**
preparation from ionograms for I.G.Y., **438**
electron distribution in, derivation of $N(h)$ profiles

for, **1552**
over Slough, **806**
electron energy levels recorded at 470–1880 km, **3294**
electron-ion recombination measurements on nitrogen, **125**
equatorial, electric-current measurements by rocket magnetometer in, **2968**
e.s. field measurements by rocket or satellite, **3713**
F region, bifurcations in, at Baguio, 1952–1957, **802**
drifts in, horizontal, at Waltair, **2242**
electron and ion density distributions in, **2579**
height gradient of electron loss in, **805**
h'f records at Macquarie Island, **2241**
inhomogeneous structure of, **2244**
magnetic-storm effects on, **1563**
physical conditions and effects of, **1555**
solar-activity effects on, **2245**
spread-echo observations at Brisbane, **454**
triple-splitting measurements at low latitudes, **1885**
Ionosphere, F_2 layer, critical frequency, derived from quality figures of WWV transmissions, **135**
variation near auroral zone during magnetic disturbances, **803**
world-wide distribution, **129**
drifts in, effect of magnetic activity on, **2586**
electron-density variations from critical-frequency data, **4055**
electron production rate in, **800**
equatorial, diurnal development of, **3707**
horizontal movements in, vertical-incidence recordings of, **2243**
influence of electron-ion diffusion on formation of, **128**
ionization, relation of magnetic dip to, **2584**
lunar variations of, semidiurnal, **1196**
magnetic field calculations at Dakar, **133**
model for, **3705**
observations at Halley Bay, **1881**
polar, critical frequency, diurnal and annual variations of, **1882**
structure and movement of large inhomogeneities in, **2581**
world-wide electron density distribution, anomalies in, **3706**
geomagnetic tides in, origin of L currents causing, **2247**
heating by hydromagnetic waves, **2585**
height, changes deduced from v.l.f. phase velocity measurements, **2735**
virtual, measurement of, **3715**
h'f records, coefficients for $N(h)$ profiles from, **3303**
inhomogeneities, irregularities of refraction due to, **2251**
ionograms, accurate virtual height from, method of obtaining, **2249**
lower, abnormal ionization associated with cosmic-ray enhancements, **1562**
'Chapman behaviour' in, **3301**
nocturnal ionization of, effect of vertical drifts on, **1878**
solar-cycle influence on, **130**
magnetic-storm effects on, **134**
measurements on, instrument effects in, **807**
motions in, interpretation of observational data on, **1556**
night-time variation, interpretation of l.f. ionograms for, **1558**
outer, electron density distribution from whistler data, **3307**
electron density and neutral particles in, **2967**
reflection coefficient at v.l.f. from measurements of atmospherics, **2589**
refraction of extraterrestrial waves by, **2973**
research in Hungary 1954–1956, **452**
review for 1958, **1199**
rocket observations of, **1559**
self-demodulation and self-distortion of radio waves in, **2252**
solar-eclipse effects on, observations at Freiburg, **131**
observations at Singapore, Dec. 1955, **1883**
solar-flare effects on, detection of, **1181**
sounders, automatic frequency-sweep, Type C-4 equipment for I.G.Y., **1564**
back-scatter, 3-frequency, for I.G.Y., **1565**
sounding of, aerial to eliminate ground-wave interference in, **710**
echoes obtained in minauroral region, **457**
experiments using back-scatter technique, **1197**
storms, morphology of, **2248**
stratified, with weak irregularities, reflection from, **2250**
structure of, dynamic model for, **2966**
temperature and electron-density determinations by vertical-incidence scatter measurements, **4061**
turbulence in, **2577**
winds in, and S_q variations, **453**
Ions, emission, secondary, from metal surfaces, **1508**
pressure generation by ion-drag, **3637**
sources, high-current, **1986**

L

Lenses, (See also Aerials; Electron lenses)
microwave, axial phase anomaly in, **713**
'conflection'-type, tests on, **1450**
design of, **1100**
dielectric sphere as, **714**
Luneberg-type, general solution for refractive index of, **24**
properties of slotted dielectric interface for, **3584**
scanning, design for minimum phase error, **1101**
spherically symmetric, design method for, **3583**
stepped-index, **2854**
Lightning. See Atmospherics.
Limiters. See Circuits, limiter.
Loudspeakers, (See also Acoustics; Sound; Transducers)
acoustic testing of, **1761**
with bass-reflex cabinet, acoustic interactions in, **2456**
analogue network for performance calculations, **1763**
column-type, for public-address systems, **2824**
design methods for improved performance, **1762**
diaphragms, rigidity of 'sandwich' construction, **334**
e.s., development and constant-charge operation of, **8**
generating high-intensity noise for component testing, **692**
impedance and phase measurements on, **2823**
ionic, design and performance of, **1759**
with modulated air flow, for high-intensity sound, **3922**
monitoring, performance criteria and design of, **333**
permanent magnets for, **1760**
response of, theoretical study near principal resonance, **1433**
Luminescence, (See also Electroluminescence; Phosphors)
control by charge extraction, **473**
Luminescence, and exo-electron emission of inorganic crystals, **3002**

M

Magnetic effects, (See also Hall effect)
Faraday rotation, design of bimodal cavity for experiments on, **770**
galvanomagnetic properties of Fermi surfaces, **3271**
magnetoresistance of metals in high fields, **3337**
magnetostriction, linear, form effect in, **2930**
Magnetic fields, amplification by high-current discharge, **401**
cosmic, force-free, **784**
of ferrite ellipsoid, **403**
flux density measurement by paramagnetic resonance, **3056**
flux function and induction calculations, **4023**
improvement in detecting power of search coils for measuring, **2351**
interplanetary, and cosmic-ray variations, **783**
measurement, electrodynamic gradiometer using microvibration technique, **218**
by nuclear-resonance technique, **1644, 3824**
using semiconductor, **1972**
probe, Bi, miniature, based on Hall effect, **1973**
uniform, effect of permeable alloy cylinder in, **90**
Magnetic properties, hysteresis, creep characteristics, influence of temperature on, **1294**
from susceptibility measurements, **4024**
of (Ni,Li)O, **3799**
permeability of iron wire under action of circular alternating field and d.c. longitudinal field, **3645**
of perovskite-type mixed crystals $LaSrCoO_3$, **890**
remanence, measurement in thin films, **1314**
susceptibility, of Cu-Ni and Ag-Pd alloys at low temperatures, **190**
measurement, by analogue of Wheatstone bridge, **1313**
on Pd mixed crystals, **3790**
of transition-metal silicides, **1274**
Magnetization, of Au_2Mn, influence of pressure on, **1273**
theory of, system of magnetic moments in, **3644**
Magnetohydrodynamics, spherical vortices in, **92**
Magnetometers, influence of self-inductance of core winding in, **3058**
Magnetoresistance. See Magnetic effects.
Magnetostriction. See Magnetic effects.
Magnets, permanent, stability of, factors influencing, **1960**
powder, properties of, **1961**
Mathematics, characteristic functions of $\Delta u + k^2 u = 0$, asymptotic nature of, **2696**
elliptic integrals, numerical evaluation method, **549**
flow-diagram analyses, **1964**
forced-oscillator equation, simple-subharmonic solutions for, **4146**
Fourier analysis, template method for evaluation, **1268**
generalized Rayleigh processes, **210**
geometric-analytical theory of transition, **3049**
integral equations, approximate solutions of, **209**
Lagrange equations in electrical networks, **360**
Laplace equation, numerical solution for Cauchy conditions, **3050**
Laplace expansion, modification for network analysis, **548**
Laplace transformation, for summation of weakly convergent series, **2695**
Mathieu and related functions, regenerative modulation process as analogue for, **2509**
parametric solutions of nonlinear differential equations, **1963**
sampling theorems, **3417**
smoothing of data, **208**
statistics, analysis of errors in determination of mean value, **1638**
switching algebra, solution of equations in, **1297**
ternary, **1636**
switching functions, classification and minimization of, **3048**
toroidal functions, theory and numerical tables, **4145**
vectors, probability distribution of phase with Rayleigh-distributed component, **3416**
Weber's equation, approximation method of solving, **913**
Liouville method applied to, **912**
Z transforms, derivation and applications, **1637**
Measurements, (See also individual subjects)
calibration centre at Boulder, Colorado, **1302**
of characteristics of u.h.f. quadripoles, **1968**
of cross-spectral density of random functions, **2349**
microwave, interferometer and grating-spectrometer techniques for, **563**
of polarization, with instantaneous display, **3432**
of phase and amplitude, 0·01 c/s–10 kc/s, for testing control systems, **1651**
of phase and time delay, video transmission test set, **4159**
response-time delays in equipment, correction formulae for, **551**
r.f., reciprocity in, **917**
of r.f. radiation, survey of techniques, **2714**
slotted-line, logarithmic chart for evaluation of, **2702**
of valve temperatures, using phototransistor pyrometer, **3424**
Metals, (See also Alloys; Conduction; Ferromagnetic materials)
Al, surface finishes for, **1962**
alkali and noble, band structures of, **910**
Bi, infrared transmission of, de Haas-van Alphen-type oscillations in, **2620**
diamagnetism of conduction electrons in, **2194**
electron structure of, **418**
high-purity, **486**
isotropic, galvanomagnetic, thermomagnetic and thermoelectric effects in, **161**
surface impedance of, h.f., quantum theory of, **1221**
ultrasonic absorption in, collision-drag effect for, **2444**
Metals, ultrasonic attenuation by electrons in, **3336**
Meteors, magnetic effects from, absence of, **106**
radio-echo height distribution, theory of, **2940**
radio search method for weak showers, **2227**
reflection of radio waves from, Booker's theory for, **1527**
trails, drift of reflection point along, **2226**
echoing points, height and electron density from c.w. measurements at 27 Mc/s, **2941**
electron density in, approximations for, **2224**
over-dense, oblique echoes from, **2225**
reflection of radio waves from, research applications of, **1526**
velocity of, c.w. technique for measurement, improvement to, **105**
Meters, galvanometer, feedback systems for, **2707**
mirror-type, improved performance using photoelectric compensating circuits, **2354**
ohmmeter, accuracy of, **1649**
phasemeter, for 1–100 c/s, **1319**
voltmeter, digital, **2355**
high-voltage, using electron beam, **560**
wattmeter, double-vane torque-operated for 7 kMc/s, **223**
thermoelectric, for 50 c/s–30 kc/s, **1320**
torque-operated, for 3 cm λ, **2359**
Microphones, (See also Transducers)
carbon, powder for, deterioration of, **3189**
preparation of, **1758**
cardioid, theory of, **2092**
concentration coefficient and directivity factor in surrounding noise, **691**
condenser-type, for airborne ultrasonic applications, **2448**
differential-type, characteristics of, **1757**
dynamic, acoustic-front damping in, **2455**
effect of mechanical vibrations on, **690**
e.s., uniangular, **1432**
gradient-type, for intercommunication systems, **2094**
magnetic, miniature, construction of, **1431**
probe-type, design for, **1429**
standard, calibration of, absolute methods for, **1430, 2093**
Missiles, guided, miss-distance indicator based on space-coupled oscillatory system, **2601**
Mixers, microwave, design for minimum noise figure, **2874**
Modulation, amplitude, microwave, by ferroxcube, **1151**
amplitude and frequency, transient response of networks and transmission lines for, **2186**
asymmetrical, distortion calculations, **3465**
frequency, negative-feedback method for broadcasting transmitter, **3872**
phase, mathematical treatment of power in, **3851**
phase-shift circuits for s.s.b. and quadrature, **4196**
pulse, accuracy obtainable with transistors, **1827**
markerless systems for communications, **956**
pulse-code, with amplitude keying, channel capacity, **3103**
signal/noise ratio in, **2009**
pulse-width, effect of carrier f.m. on, **4194**
single-sideband, multiphase, suppression of unwanted sideband in, **589**
phase compensation method for, **588**
system for, **587**
Modulators, ferrite, microwave, **1825**
frequency, diode reactance-type, **2187**
using ferroelectric capacitor, **3247**
for 'marginal' oscillator, **1826**
portable unit for television link, **2034**
pulse-code, magnetic-amplifier circuit for, **2188**
shunt-type, as phase detector, error in, **2899**
Molecular systems, effective radius of electron in, **1858**
elastic model of lattice defects, **1173**
electron-phonon interactions in, and impurities in metals, **1859**
theory of, **2215**
energy-loss spectrum of electron interaction in solids, **2931**
energy potentials in crystals, Fourier coefficients of, **782**
energy states of one-dimensional crystal, **1174**
imperfections in solids, relations between, **1175**
negative-mass charge carriers in, energy absorption by, **3747**
nuclear polarization by means of 'hot' electrons, **4011**
plasma resonance in solids, theory of, **781**
spin-wave theory for, validity of equations in, **2214**
Zeeman splitting of paramagnetic ions in, **2549**
Moon, radio echoes at 412·85 Mc/s, rapid fading rate of, **1525**
radio observations of surface of, **1863**

N

Navigation aids, (See also Direction finders; Radar)
airborne, Doppler systems, characteristics of, **2979**
review of performance of military equipment, **2608**
self-contained, with automatic computer system, **2599**
for aircraft, automatic blind-landing system, B.L.E.U., **464, 1892, 3723**
collision detection without range data, **3722**
for distress beacon, operating on 243 Mc/s, **1891**
Doppler omnirange system, **2610**
VOR, design considerations, **1897**
'Vorac', rotating aerial array for, **2120**
flight testing of, **460**
radio equipment for B.O.A.C.'s Comet, **1890**
TACAN, general description of, **461**
beacons, metallic reflectors for, **1582**
Decca, Doppler sensor, description of, **820**
Mk. 10 receiver, air trials of, **462**
Dectra, interim report on field trials of, **463**
d.m.e. system, Australian, 206-Mc/s receiver for, **145**
Navigation aids, d.m.e. system, using common-frequency transceivers, **146**
infrared, search-system range performance, **4070**
simulation techniques for system evaluation, **4071**
marine, electronic clock coder for radio beacons, **4049**
v.l.f., radux-omega system, phase stability measurements for, **2736**
Networks, (See also Circuits; Filters)
active, *RC*, synthesis of, **3978**
combining, 3-band, **733**
linear, transfer properties based on growth of spectral energy, **3220**
matching, 'immittance' chart design method for transistor measurements, **1115**
multipole, analysis of multitapped potentiometers with loaded output, **2159**
RLC, topological analysis for, **2157**
'traditor', nonenergic nonlinear elements in, **2872**
2-phase, design of, **2158**
quadripole, analysis based on determinant technique, **48**
CR divider, response of, **47**
general theorem for synthesis of, **2495**
group delay and group velocity related to transfer function, **1798**
using gyrators, as nonreciprocal systems, **2145**
for impedance conversion, **1480**
LC, synthesis of, **2147**
linear, asymmetric, iterative analysis for, **2869**
passivity condition for, **1800**
transient analysis with f.m. input, **2148**
lossy, geometric representation of, **1477**
microwave, matrix analysis for, **2149**
voltage-mode displacement for definition of, **1114**
Minkowski model of Lorentz space in analysis of, **1799**
non-Euclidean geometry in, **3606**
symmetrical, analysis by voltage-node displacement method, **1801**
synthesis of, using symmetrical lattice structure, **2146**
transfer-function approximation by polynomial, **3976**
transformation theorem for, **2496**
twin-T, response time of, **730**
u.h.f., 3-point measuring method for, **1968**
RC, asymmetrical, synthesis of, **1113**
transients in, analysis using Laplace transformation, **728**
2-terminal, negative-resistance, **1476**
reactance theorem for, **1797**
3-terminal, nonreciprocal element for topological analysis, **2871**
Noise, (See also Atmospherics; Solar radiation; Sound)
in communication and servo systems, **1682**
contact, theory of, **2422**
current, in film-type resistors and semiconductor diodes, **3506**
extension of Nyquist's theory to field-excited 'hot' electrons, **2902**
Gaussian, limited, spectrum of, **1681**
simultaneous variation of amplitude and phase, **583**
measurements on noise-thermometer amplifier, **3055**
random, measurement of, in presence of television signal, **2345**
sources, diode for u.h.f., **3533**
discharge-tube, for 1 700–2 300-Mc/s band, **559**
standard, filament-type for 3 kMc/s, **2344**
statistical analysis using digital technique, **3826**

O

Observatories, Melbourne-Toolangi, **1531**
Royal Greenwich, **2550**
Oscillations, microwave, 30-3 000-kMc/s, methods of generating, **1845**
strongly nonlinear, analysis for, **80**
Oscillators, Barkhausen-Kurz, cm-λ, **1486**
blocking, with transformer-core saturation for control of pulse duration, **3989**
using transistors, analysis and design of, **2504**
waveform control methods, **56**
constant-frequency, controlled by thermistor bridge, **1482**
cryogenic, based on relaxation process in Pb film, **2875**
crystal-controlled, for equally spaced frequencies in given band, **741**
Hartley-type, theory of, **1804**
'marginal', using transistors, for nuclear magnetic resonance observations, **1805**
with servo control, **371**
testing of, **372**
thermally compensated, using thermistor, **370**
3-terminal, design of, **1483**
1-Mc/s, using transistors, **1484**
with cubic nonlinearity, ultraharmonic and subharmonic resonance in, **3611**
f.m., using transistors, **1489**
harmonic, damped, wave-mechanics treatment of, **739**
thermodynamics of, **81**
microwave, based on ferrimagnetically coupled electrons in transient fields, **4026**
mm-λ, using ferrites, **3983**
review of techniques, **3982**
multivibrator, analysis of, phase-space method for, **1806**
low-impedance, using transistors, **2503**
magnetically coupled, frequency control of, **3612**
with negative feedback, **1807**
negatively biased, **55**
using series diode for increased sensitivity, **2502**
using single triode with no filament current, **3988**
nonlinear, analysis of, **2499**
parametric, subharmonic, for digital computing, **3590**
Oscillators, parametric, semiconductor-diode, **3981**
RC, frequency-sweep, voltage-controlled, **1125**
incremental frequency control of, **1126**
wide-range, **54**
4 c/s–350 kc/s, using bridged-T circuit, **1808**
for stable carrier frequencies of 3 800–4 200 Mc/s, **3987**
stepped-frequency, for propagation tests, **1485**
sub-mm λ, using avalanche effect in semiconductor, **3875**
synchronized, transfer function of, **3979**
transistor, condition for self-oscillation in, **1809**
crystal-controlled, **1129**
graphical design method, **746**
'marginal', as magnetic-field probe, **1810**
Meacham-bridge circuit for carrier-frequency techniques, **1811**
phase-locked, **2162**
20-kc/s with 50-mW output, design of, **745**
with two degrees of freedom, stability study by differential analyser, **3980**
v.l.f., based on triangular-wave/sine-wave transformation, **2876**
using Zener-diode limiter and harmonic filter, **2160**
Wien bridge, modified, for improved characteristics, **1124**
2-valve, with feedback via π-network, **3985**
500-Mc/s, using open rectangular waveguide, **3984**

P

Particle accelerators, betatron, electron capture and limiting current in, **2718**
cyclic, controlled by h.f. field, **3440**
cyclotron, fixed-frequency, with one dee, **1985**
microtron, maximum energy and intensity in, **3837**
with star-shaped field, **2370**
linear, electron, anomalous attenuation in, **1329**
multipactor effect in, **3836**
22-MeV, **2719**
r.f. aspects of design of, **1328**
space-charge effects in, longitudinal, **1984**
tandem Van de Graaff, at Chalk River, **935**
10-MeV, design of, **934**
150-kV generator using rotating ferroelectric disks (ferrostac), **3071**
with 800-kV cascade generator, Budapest model, **1657**
Particles, charged, correlation function for, **1829**
cyclic motion in electric field, **3835**
in e.m. field, stable orbits of, **3250**
energy losses in gyrotropic medium, **3635**
e.s. field and trajectories of, **1505**
longitudinal vibrations of electron-ion beams, **1835**
in magnetic fields, trajectory plotting methods, **1832**
moving through dielectric, radiation from, **3634**
trajectory plotting, graphical-analytic method for, **3630**
Phase, measurement, using coincident slicer, **217**
using heptode mixer, **1970**
and locking of frequency changer, pulse-beat method for, **1643**
for power supply systems, **1971**
splitter, concertina-type, performance analysis, **3616**
Phosphors, AlN, electroluminescence of, **4082**
cathodothermoluminescence of, **2624**
CdI_2 and PbI_2, luminescent complexes in, **149**
CdS, blue edge emission in, mechanism of, **2269**
carrier excitation due to electron bombardment in, **3004**
edge luminescence anisotropy in, **474**
emission spectra and absorption edge of S in, **1216**
energy transfer mechanism in, **827**
excitation by ionizing radiation, **3325**
with green and red-green luminescence, **2621**
influence of magnetic field on blue fluorescence or luminous absorption of, **2622**
multiplet structure of excitons in, **3324**
pure fluorescent emission lines and luminous absorption lines at 4·2°K, **2618**
CdS and ZnS, polarization of fluorescence in, **2267, 2268**
electroluminescence characteristics and applications of, **151**
luminophore, measurement of short afterglows of, **2350**

  review of, **1595**
  SrO, (Ba,Sr)O and MgO, cathodoluminescence of, **150**
  SrS-Pr, with fluorescence larger than energy gap, **2623**
  sulphide, Ag luminescence centres in, energy levels of, **2998**
    two-stage optical excitation of, **2996**
  transient response of, **1211**
  ZnO.CdO.B_2O_3 system, phase relations and fluorescence, **3735**
  ZnS, cathodo-electroluminescence phenomena in, **834**
    cathodoluminescence efficiency of, **472**
    electroluminescence in, with a.c.-d.c. excitation, **3000**
      effects of impurities and temperature on, **152**
      based on equilibrium conditions, **832**
      particle size and efficiency of, **2266**
      under pulse excitation, **833**
      significance of particle size in, **3738**
      of single crystals with cathode barriers, **835**
    electron traps in, **1596**
    excitation spectra and temperature dependence of luminescence of, **2999**
    films, preparation from electroluminescent powder, **1598**
    preparation of single crystals by gas reaction and sublimation methods, **2625**
    short-persistence, luminescence of, **3001**
  ZnS and ZnCdS, activation by Au and other elements, **3736**
Phosphors, ZnS-Cu, chromatic effects in photoluminescence of, **1908**
    electroluminescence brightness and brightness waveform of, **1214**
  ZnS-Cu,In, energy transfer in, **4081**
  ZnS-Cu,Pb, electroluminescent, time-dependent spectra of, **4080**
  ZnS-Sn,Li, excitation and emission spectra of, **1212**

Photocathodes, interference-type, with increased yield and variable response, **2053**

Photocells, AgS, barrier-layer, determination of parameters, **638**
  amplifier, using divided crystal in bridge circuit, **1405**
  Bi-Te, photovoltaic 'sandwich' *p-n* barrier type, **2055**
  CdS, noise power and time constants of, **1010**
  classification and analysis of image-forming systems, **4237**
  classification of photoconductive materials for, **3520**
  compensating, for mirror-galvanometer measurements, **2354**
  electron-multiplier, characteristics of different types, **3155**
    linearization of response for light-intensity measurements, **2054**
    manufacture of, **3156**
    for scintillation counting, **3081**
    for stroboscopic analysis of low-intensity light flashes, **1722**
  Ge, junction-type, for control circuits, **309**
    p-n-p tetrode-type, response of, **308**
  for infrared detection, **1012**
    with beam-scanning read-out, **4242**
    InSb, preamplifier design, **4241**
    based on intrinsic absorption, **4239**
    performance measurements, **4240**
    photoelectromagnetic InSb detector, **2987**
  infrared modulator, Ge diode, **1721**
  for light sensing, based on transient response of grain boundaries, **3788**
  operating with electroluminescent cells as 'lumistor' amplifier, **3884**
  PbS, ultraviolet response of, **1407**
  photoemissive, properties of image-forming systems, **4238**
  photovoltaic, Ge, grain-boundary-type, **1723**
      p-n junction, flicker effect in, **639**
    multi-electrode, analogous to retina, **231**
    Si, *p-n* junction, **640**
  sandwich-type, CdS, conduction mechanism of, **1406**
  Se, with artificial intermediate layers, **3158**
    influence of microstructure on characteristics of, **2056**
    open-circuit e.m.f. at low temperature, **3157**
  surface-barrier diode, as photocapacitor, **3885**
  transistor, equivalent-circuit analysis of, **4233**

Photoconductive materials, (See also Semiconductors)
  CdS, absorption and reflection spectrum of, **1208**
    anisotropy in galvanomagnetic effects, **2992**
    conductivity glow curves of, **3321**
    crystal growth, at high pressure and temperature, **4077**
      by vaporization method, **1905**
    diffusion of Cu in, **3732**
    displacement of absorption edge by pressure, **3729**
    effect of deformation on spectrum of, **3730**
    effects of proton irradiation on, **2617**
    elastic constants of, **3728**
    e.s. charging in strong fields, **3731**
    evaporated layers, effect of heating, **828**
    exciton diffusion in, **2265**
    irradiation effects on, **1594**
    laminar structure of, **3727**
    lattice scattering mobility of electrons in, **2990**
    lifetime measurements using Kerr cell, **3322**
    photochemical effects and effects of O_2 on, **1593**
    polarization and wavelength of incident light for maximum conductivity, **2991**
    review of development of, **829**
    space-charge-limited currents in, **1622**
    spectral distribution of, **1904**
    spectral structure near absorption edge, **471**
    thin films, breakdown field-strengths, **2993**
  CdS and CdSe, films, bombarded by slow electrons, **2616**
    photistors, characteristics of, **1011**
    powders, response and trap distributions in, **1902**
  CdS and ZnS, internal photoeffect and exciton diffusion in, **824**
  CdSe, conductivity anomalies in, **469**
    conductivity increase under X-ray excitation, **1906**
  CdSe and CdTe, properties of, **468**
  Cu_2O, influence of adsorption on conductivity of, **3733**
    time-lag of photoeffect in, **3734**
  film-type, infrared, properties of, **4076**
  gain-bandwidth product for, **1900**
    evaluation from current measurements, **1901**
  PbS, films, effect of thickness on spectral response, **2994**
      optical properties, **4079**
      oxidized, measurements on, **2615**
      photoconductivity/time-constant relation, **3323**
  PbSe, films, chemically deposited, **830**
    investigations on films and filaments of, **470**
  performance analysis based on Fermi level, **2988**
  photoconduction and luminescence of, intensity dependence of, **1207**
  p-n junction, lateral photoeffect in, theoretical study of, **2614**
  Sb_2S_3 films, optical properties of, **1209**
    photoelectric properties of, **1210**
  semiconductor, test equipment for, **4078**
Photoconductive materials, ZnO, with ohmic and blocking contacts, photocurrent measurements, **826**
    powder, field-effect measurements on, **1903**
  ZnS, anomalous photovoltaic effect in, **2989**
  ZnTe, conductivity at high field strengths, **3726**
Photoconductivity, as function of optical absorption, **1828**
  quenching of, model for, **2263**

Photoelectric effect, photovoltaic, in CdTe films, **1907**
Photoelectric emission, (See also Electron emission)
  influence of defect levels on, **1206**
Photoemissive materials, alkali-antimony compounds, **825**
  alkali metals, peak-emission wavelengths, **4075**
  BaO, exciton-induced, **2264**
  Bi films, temperature dependence of spectral emission, **2619**
  Na_2KSb, crystal structure of, **2995**
Phototelegraphy, delay distortion correction by time-reversal techniques for, **981**
  narrow-band system using flying-spot scanner and photomultiplier, **276**
  'stop-go' scanning system for reducing bandwidth, **277**
Physics, optical and optical-electronic devices, development of, **391**
Pickups, crystal, with low effective mass, **1764**
  moving-magnet type, **2818**
Piezoelectric materials, (See also Quartz)
  (Ba-Pb)(Ti-Zr)O_3 system, properties of, **3006**
  (Ba,Sr)TiO_3, Ba(Ti,Sn)O_3 and Ba(Ti,Zr)O_3, properties of, **845**
  $BaTiO_3$, ceramic, internal friction in, **475**
    electromechanical properties of, **3333, 3334**
  CdS, hexagonal, elastic properties of, **2278**
    influence of activator and irradiation on, **3746**
  ceramic, properties of, **4086**
  Pb(ZrTi)O_3, with substituted Ca and Sr, increased dielectric constant of, **3739**
  ZnS-type, theory of, **846**
Plasma, a.c. conductivity and Langevin equation for, **3261**
  charge density of, **87**
  conductivity of, **1161**
  confinement by r.f. fields, **1511**
  in electric and magnetic fields, transport phenomena in, **400**
  electron energy distributions in, **3260**
  electron oscillations, in Hg-vapour discharge with oxide cathode, **2910**
    transit-time relation for, **1840**
  electron temperature in variable electric field, **2532**
  e.m. waves in, 'fourth reflection condition' for, **1164**
  energy spectrum of electrons in, **765**
  equilibrium properties of, **86**
  gaseous, thermal conductivity of electron gas in, **766**
  high-temperature, microwave emission from, **1512**
  ion fields, calculation of, **1160**
  I/V relation for planar diode, **1509**
  Lorentz-type, dispersion formula for, derivation of, **3641**
  in magnetic field, **3642**
    damping of e.m. waves, **2201**
    low-frequency oscillations, **3639**
    oscillations, 'hydromagnetic' wave structure of, **1162**
  magnetohydrodynamic waves in, kinetic theory of, **767**
  microwave conductivity of, **1842, 2202**
    along magnetic field, **1841**
  microwave investigation, **3262, 4021**
    of afterglow in, **2203**
  microwave scattering by, **769**
  oblique shock waves in, **1163**
  oscillations in, electron-beam excitation of, **1513, 2534**
    Lagrangian formulation for, **2911**
    nonlinear, **2535**
  oscillations and waves in, nonlinear theory of, **88**
  stability in quasistationary e.m. field, **3640**
  statistics of, **1159**
  travelling-wave focusing for containment of, **4022**
  ultrasonic absorption by, **3638**
Potentiometers, calibration of, **4157**
Power, measurement of, (See also Bolometers; Meters, wattmeter)
    density-meter design for high-intensity microwave fields, **3831**
    based on Hall effect in semiconductor, **556**
    microwave, detector characteristics, **3830**
      resistive-film calorimeters for, **4162**
      standard, bolometer-type instrument for, **3433**
      wide-band calorimeters for, **2358**
      using wide-band thermistor mounts, **564**
      at 4 kMc/s, by Hall effect in semiconductor, **1312**
    at 30–1500 Mc/s, aperiodic barretter probe for **1322**
  pulse measurement at m λ, **3829**
  standards, microwave, international comparison of, **3163**

Power supplies, (See also Batteries; Generators)
  constant-voltage, 40–1 000 V, for time-controlled unit function, **4205**
  nuclear, miniature generator Snap III for space-rocket telemetry system, **2757**
  solar battery, Si, **603**
      for earth satellites, **3862**
      effect of radiation on, **1366**
      for infrared detector, **4206**
  for space vehicles, **2399**
  stabilized, **2401**
  thermionic energy converter, **3436**
    diode, **324, 325**
    efficiency of, **3437**
    performance of, **3438**
Power supplies, thermoelectron engine, diode configuration for, **2434, (D)2435**
  transistor, rectifier giving d.c. of either polarity, **3481**
    for video circuits, **602**
  transistor-stabilized, for an electromagnet, **2758**
    5–9-V 800-mA, **601**
  for valve heaters, high-stability, using tuned amplifier and thermistor bridge, **1697**
  variable-frequency, stabilized, for instrument calibration, **1696**

Public-address systems, acoustic feedback system for increased stability, **693**
  at Brussels Exhibition, **1691**

Pulses, (See also Amplifiers; Circuits; Generators)
  distribution system using dekatrons, **1130**
  mμs, analysis of transmission through uniform systems, **362**
  synchronization, using divider vernier, **3232**

Q

***Q*-factor,** measurement method for inductances, **2709**
  microwave measurements of, **3819**
Quartz, (See also Resonators, crystal)
  anelasticity at low temperatures, **2334**
  β-type, for high temperatures, **3009**
  mechanical resonance dispersion at a.f., **1219**
  production of microwave phonons in, **2277**
  sands, dielectric properties in range 3 cm–800 m, **2272**
  visualization of ultrasonic beam in, **674**

R

Radar, airborne, for weather observations, **147**
  altimeters, Marconi Type S 244, **2612**
    miniature, X-band, **1584**
  anti-aircraft techniques, **2984**
  beam-scanning system, use of f.m., and artificial dielectric for, **2124**
  cavity resonator for artificial echoes, unwanted modes in, **740**
  cross-sections, of circular cones, **3320**
    of finite cones, **4073**
  delay lines, quartz, **2511**
  for detection of shock waves, **3447**
  determination of velocity of shock wave by, **1658**
  DEW-line warning system, **1592**
  digital counter techniques for, **2981**
  displays, bandwidth compression for transmission over telephone channel, **3724**
  distance-measurement systems, noise-modulated, **2611**
  Doppler systems, frequency stability criteria, **2607**
  echo box, remotely controlled, **1590**
  echoes, from atmospheric inhomogeneities, **819**
    filtering of, **2602**
    mesosystems associated with, **2604**
    due to meteorological effects, **2603**
    ranging systems, p.m. and f.m., comparison of, **1893**
  effect of surface reflections on rain echo cancellation, **4072**
  high-altitude, correction of slant-range distortion, **821**
  interference, mutual, reduction of, **3318**
    suppression methods, **465**
  marine, 'Escort', **2983**
    system for Rotterdam Harbour, **1589**
    3-D system for *H.M.S. Victorious*, **467**
  microwave links for remote presentation, **976**
  modulators, Si diodes as, **3110**
  moving-target system, monitor for automatic indication of jitter, **3725**
  noise in, elimination using storage system, **3319**
  noise-based, improvement in range determination by, **148**
  phantom targets at mm λ, **3315**
  phase-measurement techniques for angle and distance measurements, **1895**
  pulse, effects of a.g.c. on accuracy of, **1894**
    magnetic circuits for, **3316**
    maximum-range data, **2606**
  range calibration in, precision pulse generator for, **2352**
  receivers, dynamic compression for, **1588**
  remote presentation of data, by radio link, **1586**
  review of developments in, **1581**
  ring angels over south-east England, **2982**
  scan-converter storage tube for phone-line relay, **2605**
  scanning systems, using electronic sector scanning, **818**
    'volumetric', by ferrite phase shifters, **1896**
  simulators, marine, **466**
  sweep circuit, low-power, using transistors, **3317**
  tracking systems, scintillation noise effects, **2609**
  traffic, Doppler system for vehicle-speed measurement, **1981**
    Telefunken, **1898**
  v.h.f. low-power, for auroral research, **1574**
  8-mm high-definition equipment, description of, **1591**
Radiation, (See also Aerials)
  detectors, noise in, **4166**
    properties and efficiency of, **4164**
    spatial filtering technique for, **4165**
  e.m., from atomic explosion, **3649**
    Cherenkov, from dipole, **3647**
      in medium with spatial dispersion, **3648**
    from detonations, **3650**
    of electrons in ionized medium in uniform magnetic field, **408**
    health hazards from, **2074, 2075**
    microwave, coherent, from pulse-excited NH_3 molecules, **1165**
    stimulated emission by electrons in magnetic field, **3264**
    transition-type, from protons entering metal surfaces, **4018**
  infrared, measurement of, thermocouples and bolometers for, **1652**
Radio astronomy, (See also Cosmic radiation; Solar radiation)
  interferometer, array at Nançay for solar r.f. radiation at 9 300 Mc/s, **3659**
    high-resolution, for solar studies, **2936**
    phase-sensitive, for measurement of brightness distributions, **1177**
  interferometry using sea surface, **2219**
  Jodrell Bank observations, of Andromeda nebula at 408 Mc/s, **2937**
    of Coma Cluster at 408 Mc/s, **2938**
  principles and results of, **3273**
  radar echoes from Venus, **2556**
  radiation transfer and negative absorption in, **2218**
  review of developments in, **1581**
  r.f. emission, galactic, intensity distribution, **1176, (D)4034**
      pencil-beam survey at 3·5 m λ, **2220**
    mechanism in hydrogen nebulae, **421**
    following solar flare, **3276**
    from solar outbursts, origin of harmonics, **4035**
    from sun and planets, **3275**
    from 'supergalaxy', at 1·9 m λ, **3660**
      at 3·5 m λ, **2223**
    in Vela-Puppis region, **2221**
  r.f. sources, catalogue for declinations + 10° to −20°, **423**
    in Centaurus, Fornax and Puppis, **422**
    Centaurus-A and Fornax-A, at 19·7 Mc/s, **2222**
    Cygnus and Cassiopeia, angular diameter measurements at 10·7 cm λ, **3658**
    improved measurements of position with Cambridge radio telescope, **2932**
    on Jupiter, observations of, **1522**
    scintillation measurements, **427**
    survey at 159 Mc/s, **103**
  Russian developments in, **420**
  scattering of radio waves from Crab nebula by solar corona, **2939**
  telescopes, Ohio State University, **3962**
Radio links, for control of aircraft communication equipment, **1689**
  correlation function and power spectra of signals, **4203**
  f.m., portable instrument for measurement of i.f. level in, **222**
  microwave, fading in, **3475**
    for radar networks, **976**
  multichannel, scatter, in telecommunication networks, **600**

   using trunk coaxial cable, fluctuation interference in, **611**
  delay equalization method, **3132**
  waveform distortion testing, **4209**
 networks, European, survey of, **1707**
  Eurovision, German standards converter equipment, **4213**
  optimum design for bands IV and V, **3501**
  in Württemberg, **1692**
 picture quality, assessment of, **4222**
   test pattern for, **1393**
  comparison method for measurement of random fluctuations in, **2031**
  detail perception test, **3135, 3136, 3138**
  impairment by noise, tests on, **2408**
  use of bifilar-T trap for improving, **988**
 picture tubes, contrast filters for, tests with, **2765**
  current characteristic of, **1704**
  electroluminescent, problems of, **566**
  flat-type, for monochrome and colour, **619**
  guns for, drive factor and gamma of, **1417**
  kinescope, high-transconductance electron gun for, **322**
   measurement of resolution characteristics, **1390**
  with luminous surround, subjective tests on, **2764**
  new electron gun with transistor drive, **3128**
  sealing of, **1035**
  short, using TPF gun, **3127**
  thin, rectangular, **3171**
  110°-deflection, development problems, **284**
 projection, eidophor system, **620**
 random-noise measurement in presence of signal, **2345**
 receivers, deflection circuits, using transistors, peak flyback voltage in, **4220**
  dual-standard, for French and C.C.I.R. systems, **4217**
  effects of valve faults in, **311**
  frame multivibrator and diode separator circuit, **3499**
  i.f. amplifiers with linear phase response, **3117**
  line-deflection transformer, magnetic measurements on ferrite U-cores for, **3057**
   with tuned h.v. winding, **1387**
  line and frame output stabilization, **3123, 3124**
  line output circuit stabilization, **3871**
Television, receivers, line output circuit stabilization, using voltage-dependent resistance, **989**
  line timebase circuit, stabilized, protection devices for, **282**
  manufacture, statistical methods in, **16**
  multitriode flywheel synchronizing circuit, **3500**
  noise-gated a.g.c. and sync system for, **1382**
  pin triode for bands IV and V, **2796**
  r.f. amplifier, constant-impedance, **1384**
  scanning oscillators and synchronization, **3121**
  sound-channel, 'delta' f.m. system with a.m. compression, **2027**
   detector using drift transistor, **2028**
  synchronization, characteristics in presence of noise, **1388**
   noise-limiting circuits and a.g.c. for, **3120**
   separator using remote-cut-off pentode, **3122**
  synchronous and exalted-carrier detection in, **1378**
  synchrophase, for phase-distortion correction, **3116**
  transistor circuits, **987**
   for i.f. stages, **1385**
   for line deflection, **3126**
   for vertical-deflection system, **1381**
   for 90° deflection, **3870**
  u.h.f. tuner using r.f. amplifier, **1383**
  video output stage with wire resistor, **2347**
  X radiation from, **4219**
  for 625-line C.C.I.R. standard, **617**
 reception, effects of random noise, **3139, 3140**
  field-strength measurements and propagation curves, **288**
  measurement of service area, **287**
  vertical-polarization tests at u.h.f., **289**
 recording, film, methods and equipment in Germany, **2024**
  magnetic-tape, 'Ampex' system, **1702**
   systems for international program exchange, **3867**
 relay systems, passive, aerial calculations for, **2851**
 research work at Turin study centre, **2761**
 review of developments, **1699**
 standards converter, using vidicon, **2405**
 stations, in N. America, list of, **2030**
 studio equipment, improved design of tungsten filament lamps, **286**
  maintenance of, **622**
 systems, cable, equalization in, **3488**
  closed-circuit, coaxial-cable, using transistors, **3114**
   for industrial applications, **272**
   two-way, remote-control carrier system for, **285**
  coding method based on 'edge' detection, **3489**
  optical performance criteria, **3498**
  vestigial-sideband, phase distortion in, **3137**
  for 50-kc/s bandwidth, **982**
 test equipment, B.B.C. transparencies for testing camera channels, **984**
  waveform generator using transistors, **1373**
 test patterns, for monochrome installations, **3502**
 testing techniques for monochrome and colour transmissions, **613**
 transmission, bilingual, multichannel sound by single transmitter for, **983**
  black-level monitoring, **1377**
  cable circuits for, **273**
  correction equipment, **3495**
  delay equalization in, filters for, **737**
  limiter circuit technique, **3491**
  monitoring installations, **3869**
   in Germany, **2763**
  residual-sideband, delay equalization, **3490**
  of still pictures, using flying-spot scanning system, **1374**
  over telephone lines, experiments using 250-kc/s bandwidth, **274**
  video level control during studio switching, **3131**
 transmitters, automatic frequency translation for improving local reception, **991**
  band-I, ABN, Gore Hill, Australia, **3129**
  design of, **3492**
  Isle of Wight I.T.A. Station, and associated radio links, **1706**
  vestigial-sideband filters and diplexers, **3494**
  5- and 10-kW, **3493**
Thermistors, circuits using, design for, **40**
 for compensation of resistance and conductance, **721**
 for deriving linear temperature-control voltage, **2489**
 for u.h.f. power measurements, design of mounts for, **564**
Thermocouples, radiation, noise in, **1653**
Thermoelectric effects, (See also Semiconductors)
 in Bi, Sb, Te and Bi-Te, effect of oxide impurities on, **2315**
 in grey Se, **1272**
 Peltier heat pump, theory of, **2906**
 for refrigeration, theory of, **3449**
 at very low temperatures, **2529**
Time, (See also Clocks)
 interval measurement, by vernier technique, **3418**
 standards, atomic and astronomical, variation in speed of earth's rotation in terms of Cs resonance, **1301**
Timebases, linear, using Miller integrator and Puckle flyback circuits, **743**
Transducers, differential-transformer, **557**
 electroacoustic, calibration for operation under increased pressure, **330**
  distributed-type, **673**
  equivalent circuits for transient vibrations, **3904**
  frequency-sensitivity characteristics by spectral analysis of thermal noise, **3906**
  signal/noise performance of strip arrays, **2**
  for underwater use, **2445**
 electrochemical, 'solion', current integration with, **2023**
Transducers, electromechanical, stroboscopic method for frequency response of, **2079**
 piezoelectric, piston-type, operating in water, **1045**
  theory of, **672**
Transductors, (See also Amplifiers, magnetic)
 auto self-excited, analysis of, **1791**
Transformers, balun, for v.h.f. and u.h.f., **338**
 double-tuned, general analysis of, **3595**
 equivalent 2-terminal networks for, **1467**
 hybrid, design and applications of, **1468**
 mains, lamination data and design procedure, **356**
 pulse, with premagnetization of core, **1469**
 pulse-front response of, measurement of parameters of, **357**
 for random-noise voltages, **3214**
 transmission-line, stepped, design of, **3594**
  twisted-pair, wide-band, **3593**
 with zero phase shift, design of, **720**

Transistors, (See also Photocells; Semiconductors; Valves, crystal)
  with $\alpha>1$, current multiplication in, 1626
  alloy-junction, base resistance for, 1714
    Ge, dependence of current gain on emitter current and frequency, 3878
      with symmetrical characteristics, 2419
  alloy-junction and grown-junction types, Si, comparison of, 300
  analogue-computer determination of design data, 3508
  analysis of quadripole networks containing, 48
  applications, in 'hybrid' regenerative valve circuits, 2877
    for i.f. amplifier, 305
    in line communication systems, 594
    review of, 4228
    in television receivers, 987
  avalanche-type, 2772
    theory of, 186, 998
    transient build-up in, 2416
  characteristic frequencies of, 996
  characteristics, a.c., representation of, 2042
    curve tracer, 3060
    frequency and phase, for common-emitter operation, 634
    based on insertion-type measurements, 2048
    present limits in, 629
  charge storage during turn-off in, 2773
  current amplification of, 631
  diffused-base, evaporation alloying technique for, 307
    manufacture of, 4229
    mesa, in f.m. receiver, 4188
      for range 10–20 000 Mc/s, 635
  diffusion capacitance in, 3148
  drift-type, current gain to 105 Mc/s, 3880
    diffused-base, for 1-kMc/s, properties of, 3510
    equivalent circuits for, 3879
    h.f. power gain of, 3881
    internal current gain of, 999
    transmission-line analogue of, 3153
  effective collector capacitance in, 632
  emitter efficiency of, 2043
  equivalent circuits for, 1009, 1718
    model-based derivation of, 2770
    and operation at l.f., 2781
    T-parameters at a.f., 2782
  fluctuation of parameters in, origin of, 628
  Ge, breakdown voltage of, 3519
    current amplification factor with carrier injection and extraction at high temperature, 3882
    diffused minicrystals for, 637
  grain-boundary, for low-temperature operation, 1712
  grown-junction, *n-p-n*, Si, construction of, 301
  h.f., equivalent-circuit analysis and characteristics of, 2423, 2768
    Ge, design theory and production of, 1000
    Ge and Si, 3509
    production techniques for, 2049
    progress in development of, 1399
  h.f. phenomena in, model for, 3154
  high-current mode of operation of, 1004
  hook, properties of, in switching and amplifying circuits, 753
  interchangeability chart for 500 types, 3517
  lattice defects in, influence and creation of, 2771
  life expectation of, in earth satellites, 2780
    mechanisms affecting, 1715
  limiting-frequency determination up to 1 kMc/s, 4232
  measurements, of α cut-off frequency, 2705
    apparatus and techniques for characteristics in 3–250-Mc/s range, 1304
    using bridge techniques, 3430
    of capacitances, 3425
    of current gain, 3426
      automatic equipment for, 3427
    d.c.-.a.c. beta tester, 1647
    of equivalent-circuit parameters, 1646
      simulator for, 4156
    sweep generator for c.r.o. display of β/I_e characteristic, 928
    of temperature-dependent base leakage current, 1974
    of v.h.f. characteristics, design of matching networks for, 1115
    wide-band bridge for, 1002
  as network element at l.f., 1719, 3518
  noise figure of, influence of inductive source on, 2047
  parameter conversion, using Jacobians, 2775
  point-contact, effect of magnetic field on, 630
  power-type, cooling system for, 636
    Ge, with Al electrodes, 1001
      applications and performance limits, 302
    for horizontal-deflection stage, 306
    increasing efficiency of, 978
    techniques for improving, 2769
  selective etching of, 1402
  shot noise in, 2413
  Si, manufacture of, 1007
    Transistors, Si, temperature dependence of mobility and lifetime in, 3150
  small-signal parameters for, variation of, 995
  stabilization, calculations for, 2051
    of gain over wide temperature range, 4231
    using negative-temperature-coefficient resistors, 2052
  surface-barrier height changes in, method of studying, 633
  surface-effect immunity in, structure giving, 4230
  structure-determined gain-band product of, 997
  switching parameters, 723
  switching-type, 'deplistor', 2420
    Si, *p-n-p-n*, 3883
    for telephone service, 2778
    theory of, 1401
    with thyratron characteristics, and related devices, 1006
      'thyristor', high-speed, 1005
      with tungsten point in collector, 2777
      3-terminal, 2046
  tecnetron, 303
  temperature distribution in, 3149
  terminology and notation, revision of, 1008
  tetrode-type, characteristics, applications and construction of, 3152
    field-effect, 2779
    h.f., grown-junction, Si, theory, characteristics and applications of, 3516
  thermal effects in, evaluation of, 299
  thermal equivalent circuit for, 1720
  thermal stability criteria, 1713
  transconductance as parameter for, 1403
  transient response of, calculations for, 2774
    unified representation for, 2050
  transit-time analysis of, stored-charge method for, 2417
  u.h.f., characteristics of, 2044
Transmission lines, (See also Cables; Waveguides)
  coil-loaded, phase and group delay in, 698, (D)3193
  delay, interdigital, dispersion in, 1022
    lumped-parameter, linear, construction technique for, 697
    surface-wave propagation conditions along, 696
  with distributed conductance, for e.m. wave absorption, 1068
  equivalent circuits for, magnitude of errors in, 1067
  exponential, for impedance matching, 1070
  helical, theory of, 2459
  inhomogeneous, for absorption of e.m. waves, 1765
    lossy, applications of, 3192
  laminated, Clogston-type, experimental, 2102
    nonuniformities in, 2101
  matching, circle diagram for, 2460
  measurements, logarithmic chart for evaluation of, 2702
  multiple, theory of, 2458
  pulse, mμs, propagation constants of, 362
  return loss of, 12
  surface-wave, cylindrical, power radiated from, 1078
    excitation of radiation by discontinuity on, 2097
    Goubau-type, tests on, 10
    impedance measurement method, 1069
  surface-wave-propagation theory for stratified medium, 939
  2-wire, balanced, screened, characteristic impedance of, 3928
Transmitter-receivers, for outside broadcasts, f.m., 80-W, 4204
Transmitters, (See also Television)
  a.m., class-C output stage for, 624
  broadcast, automatic monitoring system for, 1397
    combined operation of, using bridged-T network, 623
    common-channel operation of, synchronization techniques for, 4224
    m.f., common-channel common-program operation of, 1690
    network in Württemberg, 1692
    s.w., 100-kW, Type-SOZ 294/00, 293
  f.m., remote control and change-over equipment for, 292
  h.f., 60-kW r.f. power amplifier for, 290
  linear-amplifier, for independent-sideband operation, 291
  sea-rescue, 2-Mc/s, with ferromagnetic aerial, 4223
  s.s.b. and i.s.b., rating of, 3503
  telegraphy, Post Office, at Ongar, 3142
  v.l.f., c.w., for ionospheric investigation, using power-line aerial, 3873
  W/T, below 50 Mc/s, I.R.E. Technical Committee report on test methods, 1396
  500-kc/s, 4-W, using transistors, with automatic keying, 3504
Troposphere, (See also Atmosphere; Wave propagation, e.m.)
  climatology of radio ducts, 4053
  radio echoes from invisible objects in, 2240
  refractive index of, models for, 2725
Tuners, permeability, 1678
Tuning indicators, electron-beam, Type-EM84, for voltage indication, 2073

U

Ultrasonics, (See also Absorption; Scattering; Transducers)
  applications, to high-fidelity video recording on film, 931
  diffraction of light by, 678, 1751
  distortion of small-amplitude waves in liquids, 2814
  field due to piston-type resonator in liquids, 1423
  generators, electrostrictive, electrode deformation in liquids, 2812
  interference filters, variable-frequency, 677
  interferometer design for measurements in liquids, 2816
  measurement of field, quartz probe for, 1752
  measurement of velocity, pulse technique for metals with low attenuation, 2449
Ultrasonics, measurement of velocity and elastic moduli at high temperature, 2815
  research at N.P.L. of India, 3177
  velocity, in liquids under pressure, pulse measurement of, 1
    in water near freezing point, 2811
  waveform determination by light refraction, 1050, 3538
  wave-train synchronizing technique for equipment testing, 3064

V

Vacuum technique, 'clean-up' effect, hypotheses for, 2986
  getter-ion pumps, theory and design data for, 1899
    Ti, 1204, 1205
  getters, Ba film, 2613
    Ti, 4074
  grades of vacuum in electron and ion tubes, 2262
  measurements of gas evolution or sorption of anode materials, 2985
Valves, (See also Cathode-ray tubes; Electron beams; Rectifiers; Transistors)
  amplifier, general analysis for transistor, triode and beam-deflection types, 2041
    for wide-band operation, data for, 1032
  construction of, trends in, 2793
  cooling techniques, 4252
    'vapotron', 654
  crystal, and associated equipment, data on, 3592
    diffusion techniques for, 184
    production techniques, development of, 294
    review and characteristics of, 3147
  crystal-diode, analogue-computer determination of design data, 3508
    avalanche effect for generation of sub-mm waves, 3875
    circuit representation and pulse method of voltage division for, 2035
    d.c. characteristics of, 2410
    Ge, annealing of radiation-induced $1/f$ noise in, 298
      manufacture of, 1709
      as mixers, noise at low temperatures, 3876
      new types and applications of, 994
      noise temperature ratio variation with temperature, 627
      Russian GD-Ts type, blocking junction process in, 1708
      time-lag in, 2767
    Ge and Si, tests for r.f. noise in, 3507
    Ge-In-Sb, diffusion-type, for mμs switching, 3144
    hole storage in, 'turn-on' and 'turn-off' times for, 626
    inductive behaviour under high loads, 2036
    influence of adjacent connections on characteristics of, 1398
    logarithmic characteristic of, test method for, 2038
    microwave, mixer-type, with improved conversion efficiency, 2414
      recent developments, 3877
    nonlinear-capacitance, for frequency conversion, 3145
    PbS, I/V characteristics of *n-p* contacts on galena, 3874
    p-n-p-n and *p-n-p-m*, as 2-terminal switches, 2044
    point-contact, d.c. and a.c. characteristics of, 3143
      effect of geometrical factors on characteristic of, 2411
      electron-hole transition in, 185
      GaAs, for u.h.f. applications, 1710
      Ge, current noise of, 3506
      Ge and Si, characteristics and manufacture of, 296
    semiconductor-semiconductor 'point contact', 2037
    shot noise in, 2413
    Si, construction and properties of, 297
      as voltage-reference devices, 2039
    switching-type, from plastically deformed Ge, 2412
    tunnel-type, for h.f. applications, 3505
      phonon processes in, 4226
    'variode', for gating and control circuits, 4225
    V/I characteristics of, 625
    Zener-type, list of manufacturers and applications of, 1711
  diode, coaxial-type, for microwave detection, 2794
    as noise generator for u.h.f., 3533
    planar, reference-type, for test purposes, 4253
    saturated, surface structure of filaments in, 1418
    space-charge neutralization by ions in, 2432
    spherical, azimuthal electron flow in, 2433
    as thermionic energy converters, 324, 325, 2434, (D)2435
  diode and triode, space-charge, shot noise in, 2436
  double-triode, Type-PCC88, characteristics and application for cascode circuit, 655
  electron-beam, amplifier, noise due to cathode in, 1023
    using beam of flat elliptical cross-section, 3887
    crossed-field, noise in, 313
    current and velocity fluctuations at potential minimum, 320
    defocusing system for microwave detection, 1413
    design of transition region for, 1017
    energy relations in, 4245
    equations of space-charge flow, 3886
    focal length of diaphragm for, 1416
    'helitron' oscillator, 319
    interception noise in, 3165
    magnetically focused, current distribution in, 644
    noise in, effect of electron lenses on, 1726
      mechanism of reduction of, 1727
      reduction by low-potential drift region, 1728
    for parametric amplification, 1025
      by pumping of fast space-charge wave, 1412
    parametric-amplifier, 321
Valves, electron-beam, parametric-amplifier, cavity-type, 2066
      design of couplers for, 2067
      with transverse modulation, 4247
    as parametric amplifier and frequency converter, 2065
    propagation of perturbations in, 4246
    retarding system with helix in dielectric, analysis of, 3889
    space-charge-wave excitation for Brillouin flow, 1735
    space-charge waves in, 2058
    surface-wave electron velocities in magnetic field, 2786
    v.m., generation of second harmonic in, 1409
  electron oscillations due to transit-time effects in, 4251
  flicker noise in, effect of cathode porosity on, 1028
  gas-filled, cold-cathode, tetrode, effect of trigger pulse polarity on anode breakdown time, 3174
      triodes for switching, 2443
    as noise source, for cm λ, measurements on, 658
      u.h.f., helix-coupled, 559
    stabilizer, neon-argon-type, effect of argon content on, 2442
    'Störmertron', for simulating solar proton streams, 1864
    thyratron, ceramic, for high-power radar, 3535
  grid emission in, properties of Ti for preventing, 1030
  for guided missiles, development of, 310
  klystron, energy distribution of electrons in, 2424
    frequency control by magnetic amplifiers and transistors, 1737
    high-power, pulsed, design of, 1410
    low-power, water cooling system for, 312
    multicavity, effect of beam coupling coefficient on wide-band operation of, 1015
    multigap, 2785
    pulse-modulated beam current for mixer operation, 1016
    reflex, linearization of f.m. characteristic of, 1739
      Type-TK7, 1730
      wide-range tuning cavities for, 3525
      as 11-kMc/s negative-resistance-type amplifier, 1741
    resonant-cavity design theory, 3890
    2-cavity, ballistic analysis of, 1729
  magnetron, a.c.-operated, advantages of, 3161
      current limitation by inductance, 3162
    cut-off characteristics of, 2057
    c.w., 2·5-kW, Type-7091, 4244
    diffusion theory of, 645
    ferrite-tuned, 3163
    mm-λ, development of, 4248
    planar-diode, space-charge-limited current in, 1018
    pulser design for, 648
    reflex-type, with voltage control of frequency, 3528
    single-anode, diffusion theory for, 646
    space-charge theory, considering electron scattering, 3160
      electronic conductance in, 2425
    split-anode, diffusion theory for, 647
  manufacturing techniques, 3523
  measurement method for mutual conductance, 3059
  microminiature, heaterless, for modular circuit construction, 2863
  microphony in, analysis of, 1013
    effects of, 3896
  microwave, output window, design of broadband matching for, 643
    review of construction techniques, 4243
    survey of, 2784
    wide-band, new developments in, 642
  receiving-type, circuit effects of faults in, 311
    formula for mu of, 3170
  with rectangular envelopes, theoretical comparison with cylindrical forms, 3531
  shape, comparative study of different forms, 3895
  subminiature, vibration tests for guided-missile applications, 2431
  switching, trochotron, 1724
  transit-time, strophotron-type, for u.h.f., 1725
  travelling-wave, amplifier, C- and L-band, design and characteristics of, 2063
    backward-wave, using helical electron beam in unloaded waveguide, 3164
      minimum-noise conditions in, 1734
      as mm-λ voltage-tuned oscillator, 3529
      M-type carcinotron, electron trajectories in gun of, 318
      oscillator, 20–40 kMc/s, 1742, 29–74 kMc/s, 1740
      with ridge-loaded ladder circuit, 2790
    'coupled-mode' theory of, coupling coefficients in, 1014
    coupled-resonator slow-wave structures for, 650
    crestatron, 2427
    with crossed-field periodic structure, field theory for, 1731
    dispersion of interdigital delay line in, 1022
    efficiency of, effect of collector potential on, 314
    electrostatically focused, 1414
    experimental c.w. power-type, 2787
    exponential electron gun for, 2064
    gain and stability of, effect of attenuator surface on, 1411
    helix design data, 649
    helix-type, for 48 kMc/s, 1415
    hybrid-type, for pulsed amplification, 1733
    leakage flux around focusing magnet for, analysis of, 315
    nonlinear theory of, 2426
    O-type, effect of double beams in, 317
    O-type and M-type, spread of electron velocities and bandwidth of, 316
    with periodic circuits, characteristics of, 1732
    periodically loaded, wave matrix treatment of oscillations in, 1020
Valves, travelling-wave. slow-wave structures for mm and sub-mm λ, 1743
    survey of, 1019
    theory of electron waves in periodic structures for, 1738
    theory of electron waves in retarding systems of, 2062
    v.h.f., amplifier and oscillator, 1024
  triode, disk-seal, transmitting-type, for frequencies up to 900 Mc/s, 2797
      Type-2040, influence of penetration factor fluctuations on conductance of, 2437
      for 4-kMc/s amplifier, 2798
    pin-type, Type-PC86, for bands IV and V, 2796
    for r.f. heating, class-C operation of, 1033
      intermittent use of, 2071
      as oscillator with variable load, 2795
      output power as function of load resistance, 2072
    Type-A2521, for low-noise operation up to 1 kMc/s, 1419
    u.h.f., thimble, Type-7077 and 'Nuvistor', 3534
  v.h.f. and u.h.f., 20 years' development of, 641
Vibrations, measurement of, reciprocity method for, 3178
  of membranes and resonators, variation of natural frequency with load, 1039
Voltage, peak, measurement for h.v. pulses, 920

    influence of moisture, temperature and terrain on, **3089**
    long-distance, due to E$_s$ and F layers and troposphere, **2003**
      role of turbulent scattering in, **575**
    long-range reception of television signals, **574**
    by scatter from overdense meteor trail, **576**
    in towns, **3850**
    transhorizon, field-strength measurements of, **2737**
  v.l.f., long-distance, waveguide-mode analysis of, **948**
    phase stability measurements for radux-omega system, **2736**
Waveform, recording, using homodyne detector, **3066**
    by stroboscopic methods, **1650, 2357**
  sampling comparator, **919**
Waveguides, (See also Transmission Lines)
  assemblies, integrally constructed, design and testing of, **2826**
  attenuators, ferrite-type, medium-power, **2468**
  bends in, propagation around, **2106**
  circular, with absorbing walls, attenuation of, **3194**
    containing ferrite rod, propagation constants, **341**
    containing gyromagnetic media, mode spectra, **2838**
    effect of diaphragms and corrugations in, **1075**
    ferrite-loaded, as delay device, **2116**
      perturbation method for propagation coefficient, **2836**
    loaded with paramagnetic salt, rotation of plane of polarization in, **776**
    for long-distance transmission, **2107**
  circular and elliptic, attenuation measurements, **2829**
  circulators, ferrite, low-loss, L-band, **1769**
      1-kW, X-band, **1079**
    using semiconductor Hall effect, **15**
    3-port, using Hall effect, **2113**
    4-port, **2832**
  coaxial, low-reflection junctions for, **1073**
  coiled, as delay-line, **339**
  couplers, directional, comparison of, **3936**
      end sections for matching, **1083**
      long-slot, **2112**
      measurement of directivity of, **3821**
      wide-band, interference-type, **705**
    and multimode measurement techniques, **3935**
    multiple-branch, **3559**
      hybrid ring as, **2465**
    variable-ratio power divider and multiplexer, **1078**
  curved, fundamental modes in, **3929**
  dielectric, image-type, **2827**
      characteristics at mm λ, **3930**
  dielectric-loaded, field distribution in, **3940**
    propagation of orthogonal dominant modes in, **1081**
  elliptic, characteristic impedances of, **702**
    ferrite-loaded, analysis for, **3933**
  ferrite-loaded, high-power effects in, **3937**
    as microwave limiters, **3943**
    phase-shift calculations for, **2115**
    for phase shifting, **1771**
    propagation in, **707, 1770**
    thermal effects in, **3938**
  filters, band-pass, design of, **3939**
    cavity-type, ferrite-loaded, **2467**
    ferrite-type, **2466**
Waveguides, high power, **3562**
    high-Q, design theory, **3561**
    multistage, formulae for, **53**
    theory of wire-grid transmission loss for, **3963**
  helix-type, curved, attenuation of TE$_{01}$ wave in, **704**
    influence of dielectric on phase constants for, **2100**
    in magnetic-dielectric medium, resonance in, **2464**
    mode conversion at junction with copper pipe, **3932**
    theory and application of, **703**
  irregular, critical cross-sections in, **699**
  irregularities in, reflection and scattering from, **1766**
  isolators, ferrite, design for magnetron, **11**
      field-displacement, analysis for, **2839**
    resonance-type, high-power, L-band, **3563**
      for 70 kMc/s, **1439**
  junctions, hybrid, **3560**
    matrix representation of, **2139**
    stepped, frequency compensation technique. **1077**
    transformation of admittance using variable reactance and phase shifter, **2111**
  loaded, with attenuating foil, **1772**
    evaluation of equivalent-circuit parameters by field measurement, **340**
  for low-temperature cryostats, **1767**
  manufacture of components for, electroform process for, **1436**
    frozen-mercury process for, **3553**
    techniques for, **700**
  for mm waves, **2463**
  mode transducer, centre-excited, **2831**
  obstacles in, anisotropic, theory of, **706**
  phase-shifter, ferrite-type, 'serrodyne' modulator for frequency translation, **3942**
      for 200–800 Mc/s, **3941**
    phenomenological theory for, **2837**
    90° wide-band, **2114**
  plasma cable', with brass outer conductor and external magnetic field, **2104**
  polarization measurements at 4 kMc/s, equipment for, **3564**
  propagation in, theory for discontinuous periodic structures applied to, **2103**
  propagation at sub-mm λ in, analysis of, **13**
  pulse waveform distortion due to dispersion in, **1071**
  reflectometer for, rotating-loop, **2117**
  ring circuits, nonreciprocal, resonance properties of, **2462**
  scattering in, characteristic functions of wave equation for, **2696**
  serrated, **1074**
  slotted, surface-wave launching efficiency of, **2110**
  step discontinuities in, **14**
  strip and parallel-plate types, characteristics and manufacture of, **2108**
  strip-type, characteristic-impedance calculation, **3555**
    with coaxial feed, properties of, **2828**
    directional couplers, **3556**
    ferrite-filled, propagation in, **2109**
    high-Q triplate-type, impedance and phase velocity of, **701**
    optimum dimensions for, **1072**
    as wide-band balun, **3931**
  surface-type, dielectric, excitation of, **3558**
    dielectric-cylinder, excitation of transverse magnetic wave, **1438**
    dielectric-rod, launching efficiency of wires and slots for, **2830**
    with gyrotropic medium, analysis of, **1076**
    propagation along ferrite-coated plane conductor with constant external magnetic field, **1435**
    reactance calculation for, **3557**
  switches, Faraday-rotation, for TH system, **2835**
    fast, for 70 kMc/s, **2834**
    high-power duplexer, **2833**
  switches and branching networks, comparison of different types, **1080**
  tapered, reflections in, **1768**
  terminations, with film-type resistors, **1082**
  trough-type, cut-off wavelength of, **3554**
    periodic structures in, **3934**
  wave equation for, asymptotic integration of, **2461**
Wavemeters, (See also Frequency, meters)
  absorption-type, 1–100-Mc/s, using transistors, **1979**
  microwave, cavity-type, cylindrical, **3066**
Waves, (See also Diffraction; Sound; Ultrasonics)

  space-charge and e.m., growth in moving ion streams, **3267, 4030**
Wire, U.S. specifications and codes for, **3046**

ERRATA

IN ABSTRACTS AND REFERENCES 1959

Abstract No.	
515	Change U.D.C. number to 537.311.33 : 535.215
1052	For 'F. A. Vaniar' read 'F. A. Veniar'
1529	In line 5, for 'auroral' read 'annual'
1824	In line 7, for 'frequency band' read 'energy band'
1958	For 'J. F. Ditton, Jr' read 'J. F. Dillon, Jr'
1986	Change U.D.C. number to 621.384.8 : 537.54
2113	In line 4, for 'three-part' read 'three-port'
2159	In line 7, for 'joints' read 'points'
2278	In title, for 'Electric' read 'Elastic'
2408	In line 7, for '605-line' read '625-line'
2669	For 'S. Asanabo' read 'S. Asanabe'
2720	Change U.D.C. number to 621.384.8 : 537.54
2831	In title, for 'TE$^{\circ}_{10}$–TE$^{\circ}_{01}$' read 'TE$^{\square}_{10}$–TE$^{\circ}_{01}$'
2857	In title, for '$m\sqrt{N}$' read '$N^{1/m}$'
2958	In line 4, for 'change-exchange' read 'charge-exchange'
3030	In line 5, for 'function' read 'junction'
3136	In line 5, for '3136' read '3138
3171	For 'W. R. Aitken' read 'W. R. Aiken'
3256	Change U.D.C. number to 538.566 : 535.42
3350	Change U.D.C. number to 537.311.3 : 539.23
3836	For 'J. L. Veshaeghe' read 'J. L. Verhaeghe'

IN PAPERS ABSTRACTED

The practice of allocating individual abstract numbers to corrections has been largely discontinued; a list of published corrections noted during 1959 is given below. The journal in which the correction appeared was in each case the same as that in which the original paper was published.

Abstract No.	
3235 of 1955	Jan. 1959, Vol. 14, No. 1, pp. 115–116
1405 of 1957	July 1957, Vol. AP-5, No. 3, p. 313
2959 of 1957	Dec. 1958, Vol. 5, No. 6, pp. 510–513
84 of 1958	Jan. 1959, Vol. 6, No. 1, p. 80
295 of 1958	Sept. 1959, Vol. 36, No. 9, p. 352
971 of 1958	Sept. 1958, Vol. 29, No. 9, p. 1383
1228 of 1958	Dec. 1959, Vol. 47, No. 12, p. 2105
1858 of 1958	April 1958, Vol. 3, No. 30, p. 312
1892 of 1958	April 1958, Vol. 3, No. 30, p. 312
3028 of 1958	Sept. 1958, Vol. 29, No. 9, p. 1383
3271 of 1958	Dec. 1959, Vol. 47, No. 12, p. 2084
3472 of 1958	Dec. 1958, Vol. 18, No. 12, p. 714
3544 of 1958	15th Dec. 1958, Vol. 112, No. 6, p. 2139
3890 of 1958	15th Sept. 1959, Vol. 115, No. 6, p. 1778
3902 of 1958	15th March 1959, Vol. 113, No. 6, p. 1697
3962 of 1958	Dec. 1958, Vol. 46, No. 12, p. 1913
173 of 1959	15th March 1959, Vol. 113, No. 6, p. 1696
239 of 1959	July 1957, Vol. AP-5, No. 3, p. 313
337 of 1959	Dec. 1957, Vol. CP-4, No. 4, pp. 135–137
379 of 1959	Feb. 1959, Vol. 4, No. 37, p. 220
385 of 1959	May 1959, Vol. 4, No. 39, p. 272
501 of 1959	1st June 1959, Vol. 73, No. 474, p. 976
635 of 1959	Oct. 1958, Vol. 17, No. 10, p. 117
745 of 1959	Feb. 1959, Vol. 4, No. 37, p. 220
855 of 1959	March 1959, Vol. 36, No. 3, p. 95
890 of 1959	March 1959, Vol. 9, Nos. 3/4, p. 340
1233 of 1959	15th June 1959, Vol. 114, No. 6, p. 1652
1368 of 1959	Sept. 1959, Vol. 47, No. 9, pp. 1653–1654
1372 of 1959	June 1958, Vol. 2, No. 3, p. 144
1493 of 1959	Dec. 1958, Vol. 17, No. 12, p. 36
1498 of 1959	Feb. 1959, Vol. 4, No. 37, p. 220
1559 of 1959	April 1959, Vol. 47, No. 4, p. 567
1615 of 1959	1st Sept. 1959, Vol. 3, No. 5, p. 244
1693 of 1959	Feb. 1959, Vol. 4, No. 37, p. 220
1795 of 1959	May 1959, Vol. 65, No. 5, p. 232
1952 of 1959	1st June 1959, Vol. 73, No. 474, p. 976
2024 of 1959	Oct. 1958, Vol. 2, No. 5, p. 252
2202 of 1959	15th June 1959, Vol. 114, No. 6, p. 1652
2408 of 1959	Aug. 1959, Vol. 36, No. 8, p. 314
2410 of 1959	July 1959, Vol. 47, No. 7, p. 1252
2503 of 1959	July 1959, Vol. 31, No. 377, p. 427
2750 of 1959	Aug. 1959, Vol. 47, No. 8, p. 1324
2841 of 1959	Jan. 1959, Vol. AP-7, No. 1, p. 104
3076 of 1959	Jan. 1959, Vol. 16, No. 1, p. 56
3077 of 1959	Jan. 1959, Vol. 16, No. 1, p. 56
3078 of 1959	April 1959, Vol. 14, No. 4, p. 547
3081 of 1959	Dec. 1958, Vol. 10, No. 12, p. 576
3419 of 1959	Oct. 1958, Vol. 2, No. 5, p. 252
3588 of 1959	Nov. 1959, Vol. 47, No. 11, p. 1840
3965 of 1959	July 1959, Vol. AP-7, No. 3, p. 251

LISTS OF JOURNALS

A selection of the journals which are regularly scanned is given below, together with the addresses of their publishers or editorial offices and the abbreviations of their titles as used in the Abstracts and References. Applications for copies of any journal should be made to the addresses given.

The full title of each journal is given in bold type and is followed by the address, the abbreviated title being shown within brackets. In a few cases the nature of a journal is indicated, where neither the title nor the address shows it clearly.

A

Acta Polytechnica Scandinavica, Publishing Office, Box 5073, Stockholm 5, Sweden. (*Acta polyt. scand.*)

Acustica, S. Hirzel Verlag, Stuttgart-N, Germany. (*Acustica*)

Advances in Physics, Taylor & Francis Ltd, Red Lion Court, Fleet Street, London, E.C.4, England. (*Advances Phys.*)

Akusticheskii Zhurnal, Moskva, B-64, Podsosenskii per., 21, U.S.S.R. (*Akust. Zh.*)

Akustische Beihefte, as for Acustica. (*Akust. Beihefte*)

Alta Frequenza, Associazione Elettrotecnica Italiana, Milano (202), Via S. Paolo 10, Italy. (*Alta Frequenza*)

Annalen der Physik, J. A. Barth, Leipzig C1, Salomonstrasse 18B, East Germany. (*Ann. Phys., Lpz.*)

Annales de Géophysique, Service des Publications du C.N.R.S., 13 Quai Anatole France, Paris 7ᵉ, France. (*Ann. Géophys.*)

Annales de Physique, Masson & Cie, 120 Boulevard Saint-Germain, Paris 6ᵉ, France. (*Ann. Phys., Paris*)

Annales de Radioélectricité, 10 rue Carducci, Paris 19ᵉ. France. (*Ann. Radioélect.*)

Annales des Télécommunications, 3 & 5 Boulevard Pasteur, Paris 15ᵉ, France. (*Ann. Télécommun.*)

Applied Scientific Research, Martinus Nijhoff, The Hague, Netherlands. (*Appl. sci. Res.*)

Archiv der elektrischen Übertragung, S. Hirzel Verlag, Stuttgart, Germany. (*Arch. elekt. Übertragung*)

Archiv für Elektrotechnik, Springer Verlag, Berlin-Wilmersdorf, Heidelberger Platz 3, Germany. (*Arch. Elektrotech.*)

Archiv für technisches Messen, R. Oldenbourg KG, München 8, Rosenheimer Str. 145, Germany. (*Arch. tech. Messen*)

Arkiv för Fysik, published for Royal Swedish Academy of Sciences by Almqvist & Wiksell, Stockholm, Sweden. (*Ark. Fys.*)

A.T.E. Journal, Automatic Telephone & Electric Co. Ltd, Strowger Works, Liverpool 7, England. (*A.T.E. J.*)

Audio, Radio Magazines, Inc., P.O. Box 629, Mineola, N.Y., U.S.A.. (*Audio*)

Australian Journal of Physics, Commonwealth Scientific and Industrial Research Organization, 314 Albert Street, East Melbourne C.2, Victoria, Australia. (*Aust. J. Phys.*)

Avtomatika i Telemekhanika, Moskva, I-53, Kalanchevskaya ul., 15a, U.S.S.R. (*Avtomatika i Telemekhanika*)

A.W.A. Technical Review, Amalgamated Wireless (Australasia) Ltd, Sydney, Australia. (*A.W.A. tech. Rev.*)

B

B.B.C. Engineering Division Monographs, British Broadcasting Corporation, 35 Marylebone High Street, London, W.1, England. (*B.B.C. Engng Div. Monographs*)

Beama Journal, British Electrical and Allied Manufacturers' Association, 36 Kingsway, London, W.C.2, England. (*Beama J.*)

Bell Laboratories Record, 463 West Street, New York 14, N.Y., U.S.A. (*Bell Lab. Rec.*)

Bell System Technical Journal, American Telephone and Telegraph Company, 195 Broadway, New York 7, N.Y., U.S.A. (*Bell Syst. tech. J.*)

British Communications & Electronics, Heywood & Co. Ltd, Drury House, Russell Street, Drury Lane, London, W.C.2, England. (*Brit. Commun. Electronics*)

British Journal of Applied Physics, 47 Belgrave Square, London, S.W.1, England. (*Brit. J. appl. Phys.*)

Brown Boveri Review, Baden, Switzerland. (*Brown Boveri Rev.*)

Bulletin de l'Association Suisse des Électriciens, Seefeldstrasse 301, Zürich 8, Switzerland. (*Bull. schweiz. elektrotech. Ver.*)

Bulletin of the Technical University Istanbul, Istanbul Teknik Üniversitesi, Gümüssuyu, Istanbul, Turkey. (*Bull. tech. Univ. Istanbul*)

C

Câbles & Transmission, Sotelec, 16 rue de la Baume, Paris 8e, France. (*Câbles & Transm.*)

Cahiers de Physique, 165 rue de Sèvres, Paris 15e, France. (*Cah. Phys.*)

Canadian Electronics Engineering, Maclean-Hunter Publishing Co. Ltd, P.O. Box 100, Toronto, Canada. (*Canad. Electronics Engng*)

Canadian Journal of Physics, National Research Council, Ottawa 2, Ont., Canada. (*Canad. J. Phys.*)

Chalmers tekniska Högskolas Handlingar Gumperts Förlag, Göteborg, Sweden (*Chalmer. tek. Högsk. Handl.*)

Communication and Electronics, American Institute of Electrical Engineers, 20th and Northampton Streets, Easton, Pa, U.S.A. (*Commun. & Electronics*)

Communications on Pure and Applied Mathematics, Interscience Publishers Inc., 250 Fifth Avenue, New York 1, N.Y., U.S.A. (*Commun. pure appl. Math.*)

Comptes Rendus Hebdomadaires des Séances de l'Académie des Sciences, Gauthier-Villars, 55 Quai des Grands-Augustins, Paris 6e, France. (*C. R. Acad. Sci., Paris*)

D

Doklady Akademii Nauk S.S.S.R., Moskva, B-64, Podsosenskii per., 21, U.S.S.R. (*Dokl. Ak. Nauk S.S.S.R.*)

E

E.B.U. Review, 32 Avenue Albert Lancaster, Bruxelles 18, Belgium. (*E.B.U. Rev.*)

Electrical Communication, International Telephone and Telegraph Corporation, 67 Broad Street, New York 4, N.Y., U.S.A. (*Elect. Commun.*)

Electrical Engineering, American Institute of Electrical Engineers, 33 West 39th Street, New York 18, N.Y., U.S.A. (*Elect. Engng, N.Y.*)

Electrical Journal, Bouverie House, 154 Fleet Street, London, E.C.4, England. (*Elect. J.*)

Electrical Manufacturing, 205 East 42nd Street, New York 17, N.Y., U.S.A. (*Elect. Mfg*)

Electrical Review, Dorset House, Stamford Street, London, S.E.1, England. (*Elect. Rev., Lond.*)

Electronic Applications, N. V. Philips' Gloeilampenfabrieken, Technical and Scientific Literature Department, Eindhoven, Netherlands. (*Electronic Applic.*)

Electronic Engineering, 28 Essex Street, London, W.C.2, England. (*Electronic Engng*)

Electronic Equipment Engineering, Sutton Publishing Company Inc., 172 South Broadway, White Plains, N.Y., U.S.A. (*Electronic Equipm. Engng*)

Electronic Industries, Chestnut and 56th Sts, Philadelphia 39, Pa, U.S.A. (*Electronic Ind.*)

Electronic & Radio Engineer, Iliffe & Sons Ltd, Dorset House, Stamford Street, London, S.E.1, England. (*Electronic Radio Engr*)

Electronics, 330 West 42nd Street, New York 36, N.Y., U.S.A. (*Electronics*)

Elektronische Rundschau, Verlag für Radio-Foto-Kinotechnik G.m.b.H., Berlin-Borsigwalde, Eichborndamm 141–167, Germany. (*Elektronische Rundschau*)

Elektrosvyaz', Moskva, K-9, ul. Gor'kogo, 7, 8-i pod"ezd, 3-i etazh, U.S.S.R. (*Elektrosvyaz'*)

Elektrotechnik und Maschinenbau, Journal of the Elektrotechnischer Verein Österreichs, Springer Verlag, Wien I, Mölkerbastei 5, Austria. (*Elektrotech. u. Maschinenb.*)

Elektrotechnische Zeitschrift, Edition A & B, VDE-Verlag G.m.b.H., Berlin-Charlottenburg 2, Bismarckstrasse 33, Germany. (*Elektrotech. Z.*)

Endeavour, Imperial Chemical Industries Ltd, North Block, Thames House, Millbank, London, S.W.1, England. (*Endeavour*)

Engineer, 28 Essex Street, London, W.C.2, England. (*Engineer, Lond.*)

Engineering, 36 Bedford Street, London, W.C.2, England. (*Engineering, Lond.*)

Ericsson Review, Telefonaktiebolaget L. M. Ericsson, Stockholm 32, Sweden. (*Ericsson Rev.*)

Ericsson Technics, as for Ericsson Review. (*Ericsson Tech.*)

F

Fizika Tverdogo Tela, Leningrad, V-164, Mendeleevskaya lin., 1, U.S.S.R. (*Fiz. Tverdogo Tela*)

Frequenz, Fachverlag Schiele & Schön G.m.b.H., Berlin S.W.61, Markgrafenstrasse 11, Germany. (*Frequenz*)

Funk-Technik, Verlag für Radio-Foto-Kinotechnik G.m.b.H., Berlin-Borsigwalde, Eichborndamm 141–167, Germany. (*Funk-Technik, Berlin*)

G

G.E.C. Journal, General Electric Company Ltd, Magnet House, Kingsway, London, W.C.2, England. (*G.E.C. J.*)

G.E.C. Telecommunications, General Electric Company Ltd, Coventry, England. (*G.E.C. Telecommun.*)

Geofisica Pura e Applicata, Istituto Geofisico Italiano, Milano, Piazza Leonardo da Vinci 12, Italy. (*Geofis. pura appl.*)

Geophysical Journal of the Royal Astronomical Society, Burlington House, London, W.1, England. (*Geophys. J. R. astr. Soc.*)

H

Helvetica Physica Acta, Journal of the Schweizerische Physikalische Gesellschaft, Birkhäuser Verlag, Basel, Switzerland. (*Helv. phys. Acta*)

Hochfrequenztechnik und Elektroakustik, Akademische Verlagsgesellschaft Geest & Portig K.-G., Leipzig C1, Sternwartenstr. 8, East Germany. (*Hochfrequenztech. u. Elektroakust.*)

I

IBM Journal of Research and Development, International Business Machines Corporation, 590 Madison Avenue, New York 22, N.Y., U.S.A. (*IBM J. Res. Developm.*)

Indian Journal of Physics (and Proceedings of the Indian Association for the Cultivation of Science), Jadavpur, Calcutta 32, India. (*Indian J. Phys.*)

Izvestiya Akademii Nauk S.S.S.R. (*a*) seriya fizicheskaya, Moskva, B-64, Podsosenskii per., 21, U.S.S.R., (*b*) seriya geofizicheskaya, Moskva, B. Gruzinskaya, 10, U.S.S.R., (*c*) otdelenie tekhnicheskikh nauk, Moskva, M. Khariton'evskii per., 4, U.S.S.R. (*Izv. Ak. Nauk S.S.S.R.*, (*a*) *ser. fiz.*, (*b*) *ser. geofiz.*, (*c*) *otd. tekh. nauk*)
